ASTRONOMICAL OBSERVATIONS

MADE AT

THE HONORABLE

THE EAST INDIA COMPANY'S OBSERVATORY

AT MADRAS.

BY

CAPTAIN WILLIAM KINNAIRD WORSTER, ARTILLERY, F.R.A.S.
ACTING ASTRONOMER.

AND

WILLIAM STEPHEN JACOB, ESQ., F.R.A.S.
ASTRONOMER TO THE HONORABLE COMPANY.

FOR THE YEARS 1848—1852.

PRINTED BY ORDER OF

THE MADRAS GOVERNMENT.

MADRAS:

PRINTED BY J. TULLOCH, AT THE AMERICAN MISSION PRESS.

MDCCCLIV.

PREFACE.

The present volume embraces all the Observations made at the Madras Observatory since the departure of the late Astronomer T. G. Taylor, Esq., or for the years 1848—52 inclusive. The system pursued by my predecessor has been generally followed; viz., that the great mass of observations with the Meridional Instruments has been taken by the Native Assistants, it being found impossible in this climate, together with the general superintendence of two Observatories (celestial and magnetic) to undertake any continued series of observations. My observations with these instruments have therefore been limited to what was needful for occasional checks. I consider the work of the Assistants with the Mural Circle to be nearly if not quite equal to my own; with the Transit Instrument the inferiority is more perceptible, though still not very great. I have also followed my predecessor's plan in printing *results* only, on account of the voluminousness of the original observations; but exact copies in MS. of all the Observation-books will be deposited at the India House, and will doubtless be there accessible to all parties wishing to examine them.

The figure of Saturn in Plate 2 is a sad failure, but the best that the Madras Lithographers could produce after several attempts.

The hope held out in the last volume that this Observatory would soon possess an Equatorial, has been realized, not by the completion of the Instrument ordered the Court of Directors in 1842, which was not executed; but by the purchase of an Instrument originally ordered for private use. The observations with this instrument have been made exclusively by myself.

The Latitude given in the last volume has been reduced $0''.1$ in accordance with the indications of the Solar Observations as given in that volume. The Longitude has been retained unaltered.

TRANSIT INSTRUMENT.

THIS Instrument having been frequently described, it will be sufficient to state that it has a focal length of 60·4 in. and an aperture of 3·7 in.—but on my arrival at Madras in July 1849, I found the aperture of 2 in. almost exclusively employed. With a larger aperture, the brighter stars were disfigured by wings, shewing that the object glass was not exactly centered. The inconvenience of this being apparent, the centering was corrected between 16th and 19th November, by filing down two of the three brass pieces (mentioned in Vol. IV. by the late Mr. Taylor as) placed under the cell of the object glass, until stars of 1st magnitude gave a round image; since then the 2 in. aperture has been for the most part confined to Solar Observations.

The apparent difference of the pivots was found to be

on 16th December,	1849,	6·01
19th March,	1850,	5·51
13th December,	1852,	5·61

the illuminating end being least; the correction used has been between the two first dates 3·00, and subsequently to 19th March 1850, 2·78: previously to the first date the old correction left by Mr. Taylor was used, viz. 1·80. The level error, as will be evident from inspection of the Table is subject to great changes, the annual range sometimes exceeding 10, while a difference of 3 or 4 will frequently be found in the lapse of a few days, particularly after heavy rain. This is probably owing to the foundation for the Instruments resting not upon rock but sand, which in long continued rain becomes softened and allows the brick work to settle in a small degree. In consequence of injuries sustained by the setting circle on the other side, the Instrument can be used only with the illuminating end W., but the practice has been to invert the axis about the middle of every month and examine the collimation; and, as long as the micrometer was in order, to measure the distance of the central wire from the meridian mark in both positions, and thus determine the collimation error; latterly the micrometer having become unserviceable, I have adjusted for collimation whenever the error has appeared to exceed 1·0, but this has been a rare occurrence.

The Azimuth has been determined throughout by the Transits of circumpolar stars; *both* Transits of Polaris have been taken when practicable, but by reason of its low altitude this can be done during only a small portion of the year.

The equatorial intervals of the four outer wires from the central one I found to be on 4th November 1849, by 93 Transits of stars

55·14 s.	agreeing very nearly with the values determined by my predecessor* on 16th
27·67	March and implying a correction to reduce the mean of the five to the centre,
27·17	amounting to $+ 0^{s}\cdot18 \times$ sec. dec.
54·76	

In adjusting the centering of the object glass and re-adjusting collimation, a small change was produced, and the intervals were re-determined by 34 Transits as follows:—

s.
55·21
27·67
27·23
54·82

* Intervals on 1st January, 1848, { 54·91 / 27 13 / 27·23 / 54·75 } s. And after putting in a new set of wires on 16th March, 1849. { 55·15 / 27·69 / 27·15 / 54·76 } s.

so that the mean requires a correction of $+ 0^s.17 \times$ sec. dec.—applicable from 19th November 1849 to 4th March 1850. By the latter date the micrometer plate having, in spite of frequent cleanings, become stiff in its motion and nearly useless, and the intervals between the wires, being found inconveniently large, two wires were affixed to the micrometer plate, and set nearly midway between 2d and 3d, and 3d and 4th wires, and the use of the old 1st and 5th was discontinued.

The intervals were then determined as below:—

s.
27·66
13·47
13·86
27·30

The mean of 5 therefore requires a correction of only $- 0^s.01 \times$ sec. dec.—which was neglected. On 12th October 1850, the 1st wire was gone; after inserting a fresh one, the intervals were found

s
27·24
13·68
13·56
27·46

implying a correction of $- 0^s.02 \times$ sec. dec.—which was neglected.

About 12th November the values were again ascertained and found as follow

s.
27·22
13·68
13·52
27·42

requiring no correction.

About 5th February 1851, an inequality was noticed and the values were found to be

s
27·13
14·05
13·16
27·45

And after adjustment on the 10th February the values were

s
27·13
13·76
13·45
27·45

In the latter part of March the wires had again shifted and the intervals were found

s.
27·24
14·30
13·00
27·48

and after adjustment on the 26th March,

s.
27·24
13·72
13·48
27·48

on 19th April they were again found to be

s.
27·25
13·73
13·50
27·42

on 12th September the first wire was found broken and a new one inserted, when the values were found to be

s.
27·34
13·66
13·60
27·34

and after adjustment on 18th September

s
27·35
13·59
13·63
27·32

On 11th January 1852 the 4th wire was found slack, and a new pair were fixed on the micrometer plate, after which the values were

s
27·39
14·03
13·76
27·58 implying a correction of + ·016 × sec. dec.—which was neglected; these values were used until 1st October when a change being suspected the values were ascertained to be between that date and 10th December

s.
27·40
14·42
13·35
27·57 requiring a correction of + ·18 × sec. dec.

after adjustment on 10th December the values were

s.
27·32
14·05
13·70
27·60

The power used throughout the observations, as measured by a dynameter, has been 109, hitherto erroneously called 150.

The Instrument having been in use upwards of twenty years, is nearly worn out, and it will be desirable ere long to have its place supplied by one of greater power. Besides the defective state of the micrometer and of one of the setting circles alluded to above, the Ys are much worn away, and from the comparison of the right ascensions of standard stars with the Greenwich determinations, the pivots would also appear to have worn unequally.

In observing the sun, a light screen has been used since October 1849, to protect the axis from the sun's rays.

CLOCK ERRORS AND RATES.

The amount of these, as stated in the Table, has been corrected for personal equation, which was carefully ascertained for each observer, but as it was doubtful if the value of this continued quite permanent, it was but rarely employed in correcting the places of the stars, the plan adopted by Mr. Taylor being followed out, of deducing when practicable the clock error for each observer separately from his own Observations of Standard Stars, three of which were usually taken in each watch of three hours; the Standard Stars adopted being all the Nautical Almanac Stars within 30° of the equator, excepting a few which were considered doubtful, because of their places in the N. Almanac differing widely from those determined at this Observatory.

MURAL CIRCLE.

The circle having been frequently described, it will be sufficient to state that its diameter is 48; the Telescope has a focal length of 48·6 in. and an aperture of 3·6 in.; and a power of 97 (hitherto erroneously called 120), has been constantly used in observations of the heavenly bodies, the power employed with the Reflecting Collimator being about 60.

In determining the Index Error, those Nautical Almanac Stars were used which passed within 30° of the zenith, Sirius only being excluded, as being very near the limit and having also a large and somewhat uncertain proper motion. The mean Polar distances employed have been those given in Vol. VII. of this Observatory as the result of observations from 1843 to 1847 inclusive, with a correction of 0″·1, by which the latitude hitherto employed requires to be diminished, as appears both from the Solar Observations, and a comparison with the Greenwich Observations of the Standard Stars.

REVISION OF THE B. A. CATALOGUE.

This is a work which I had planned before arriving at Madras and was commenced in August 1849, it was considerably advanced before I was aware that my esteemed friend, the Astronomer at the Cape, was engaged in a similar revision.

The stars selected for Observation were, all those numbers in the B. A. Catalogue, between the N. P. D. of 40° and 155°, which depended on one modern observer, or which were otherwise doubtful; a few have been taken beyond these limits, especially to the northward; and a few of those previously well determined have been re-observed, generally from having been mistaken for some missing number in the neighbourhood. The numbers reported as "not seen," are in the course of being re-examined, they appear for the most part to be duplicate observations of another number with errors of 1ᵐ. or 1° or something of the kind.

It was intended to take four observations of each star, and this has been accomplished excepting where the stars came too *thickly* to allow of its being done within a reasonable time, or where a wrong star has been observed and the mistake not detected till the time of reduction. The great majority of these observations were taken by the Native Assistants, and may be considered creditable to them, as shewn by the general close agreement with former observers, especially Groombridge; by way of check, I have occasionally taken a turn at the Transit Instrument and, more rarely, at the Circle.

I have continued to employ Atkinson's Refractions as used by my predecessor, for the following reasons; the Native Assistants being used to the Table, I thought it undesirable to introduce a change unless it could be *proved* to be for the better; now, though Atkinson's Refractions differ but slightly from Bessel's, they appear to be rather more correct, at least in this latitude, since a comparison of the Polar distances of Standard Stars, as observed here and at Greenwich, shews, in the case of stars passing N. of both zeniths, a mean difference of only 0″·01; i. e. Atkinson's Refractions, at zenith distances from 38° to 76°, are equally good with Bessel's (used at Greenwich) from 0° to 38°; a similar comparison of the stars passing S. of both zeniths as far as 76° of zenith distance at Greenwich, shews a difference of 1″·16; (Greenwich Stars S.) those below 65° shew a difference of 1″·32 and below 75°, 1″·65; so that Bessel's fail at low altitudes; probably they may be correct for low observations N. of the zenith, and yet not for those to the S. Since a *grazing* ray N. and S. will in high latitudes pass through strata of different temperatures, and therefore be differently refracted.

In the column of magnitudes I have given the mean result, to the nearest tenth, of all the different estimations as entered in the Transit and Circle books, but do not attach much value to them; those assigned to the low southern stars, (say from 140° downwards) are certainly too low.

As much uncertainty still attaches to the amount of proper motions, I have not taken them into account in reducing the mean places to 1850; there was the less need for this, as the mean date of observation differs so very little from that epoch. The sole exception has been No. 4010, (1830 Groombridge) the proper motion of which being large and well established has been allowed for.

It will be seen from the notes, that many of the objects marked as nebulæ in the B. A. C. are loose cluster of stars; it is probable that these were not resolved by Lacaille's Instrument, and that he therefore observed the centre or brightest portion of the cluster; Brisbane or other subsequent observer would take a particular star in the cluster, and a comparison of the observations might indicate a large proper motion without any real foundation. In the cases where a conspicuous star could be selected in such a cluster, it has been observed; but many have had to be passed over, from the impossibility of identifying the object observed at the Transit with that at the Circle; for such cases the great advantage of a *Transit Circle* is most evident.

EQUATORIAL INSTRUMENT.

The Equatorial is by Lerebours and Secretan of Paris, and was originally ordered for private use and afterwards purchased by the Government. It reached Madras on 22d March, 1850, and was erected and in use by 12th April. The Object glass at first furnished had an aperture of 6·2 and 86·3 focus: this was found not only ill-centered, but also to have several serious flaws and striæ round the edge, preventing the use of a larger aperture than 4 excepting on very faint objects; and all the observations are to be understood as taken with that aperture, unless otherwise noted. On these defects being represented to the makers, they very readily engaged to furnish another Object glass, the making of which was to occupy six months, but it was not actually received here until 23d July, 1852. All the observations now given, with the exception of a few specially noted, were therefore taken with the old lens. The new lens has the same aperture as the old, but a focal length of 88·64, and is nearly perfect, clearly dividing δ Arietis and τ Ophiuchi, and perceptibly elongating B of γ Andromedæ: shewing also distinctly six stars in the trapezium in Orion as in the annexed diagram.

The Telescope is mounted somewhat like the Great Northumberland at Cambridge, in a cage of strong brass tubes forming the polar axis, with a flat brass bar by way of polar rod. The hour circle is of 13 and declination circle 14 diameter, the one reading to 5 by one vernier, and the other to 30″ by two; but single seconds in the one case and 10″ or even 5″ in the other, can easily be read by estimation. The angle between the transverse axis of the Telescope and the polar axis differs from 90° by 1′ 45″; the inclination being such as to increase observed right ascensions, with face East and in North declination, and vice versa. There is a driving clock of the German construction, the regulating power of which consists in the friction, within a conical brass box, of two steel balls attached to slender springs and turning on a spindle, and the rate is varied by raising or depressing the spindle, so as to cause the balls to rub at a wider or narrower part of the cone; it performs its work pretty well when clean, but requires frequent cleaning.

The micrometer furnished by the maker is of rather inferior quality, the screws being coarse and sensibly unequal, while the planes, in which the wires move, are separated so far as to cause a perceptible parallax. The position circle is less than 2 in diameter, which renders it rather troublesome to read, though the division is sufficiently accurate; the powers furnished were very low, ranging according to the maker's statement from 75 to 240, but as measured by a Dynameter, from 53 to 200; the Object glass of an Achromatic Microscope has occasionally been used giving a power of 340, and a Ramsden's eye-piece has lately been adapted giving with the new Object glass 293, but these are almost too great for the micrometer by reason of the parallax above-noticed. Two other micrometers (kindly lent by General Fraser) have also been used occasionally. These are designated in the observations as *Dollond's* and *Troughton's* Micrometers: the one with powers ranging to 600 and the other to 280. The value of one revolution of the screw of the former being 23″·87 and of the latter 23″·28; with the new Object glass these values become 23″·23 and 22″·65. In Lerebour's micrometer the value of screw A is 43″·36, and of B 43″·50; with the new Object glass 42″·22 and 42″·35; screw A was the one generally used: in the case of repetitions the mean of the two values has to be employed. These values were ascertained by numerous transits of stars of small polar distance; an attempt was made to ascertain if change of temperature affected the values of the screws; but it failed, as the alteration, if any, was much less than the error of observation, the range of temperature available being very small. Two Huygenian eye-pieces were furnished by the maker, with powers of 300 and 400.

The Instrument is mounted, on stout wooden tressels firmly braced, on the roof of the Astronomer's quarters, a very thick and solid terrace: the reason of placing it there was that, on account of high trees and buildings in the neighbourhood, an extensive view could be obtained from no other spot; it was intended in the first instance as an experiment, which has fully succeeded, as even when workmen have been employed about the walls, no tremors could be perceived in observing with high powers.

Instead of a rotatory roof, a folding one was erected, similar to that constructed at Poona and briefly described in the monthly notices of the Royal Astronomical Society for November 1843, which was also brought to the notice of the British

Association in 1850 by Professor C. P. Smyth. The roof is a truncated octagonal pyramid formed of eight separate frames of teak of the form shewn in Fig. 1. covered with canvas and painted, attached by hinges to eight horizontal beams arranged in an octagon and resting on eight posts, the walls between the posts being formed of weather boarding. Each frame opens independently, and when closed they mutually support each other, the edges being bevelled so as to fit correctly; the top is closed by an octagonal wooden shutter hinged to one of the frames, and which can be opened alone when observing very near the zenith; a plan and sectional elevation of the building are shewn at Fig. 2 and 3. For want of room within the building, one leg of each tressel has to pass outside of the walls, but these are carefully bordered round so as nowhere to come in contact with the tressels. The reasons for constructing such a roof in preference to a rotatory one were two-fold; the first was that of economy, the instrument being at the time private property, and consequently having to be erected at the expense of the Astronomer in the first instance, and it being also doubtful if the erection would be permanent, and the expense being about $\frac{1}{4}$ of that of the cheapest kind of rotatory roof; the second was, that from the situation it was expedient that the building erected should be as light as possible consistent with the requisite strength. It should be observed that the tressels supporting the polar axis stand over party walls, which give additional security, but it was found that even in the middle of the terrace neither a spirit level, nor even the reflection from the surface of mercury, were in the least affected by persons walking near them.

The following observations have been made on Saturn with the new Object glass.

24th August 1852, power 365, at day break. The inner faint ring was seen of a greyish tint, occupying about half the space between the bright ring and the planet; it could not be traced quite up to the planet. One dark line was also seen in the outer ring at each ansa, but not very distinctly. The shadow of the ring on the planet had a brownish tint: that of the planet on the ring was black and sharply defined—no belts were seen on Saturn excepting a broad bright band round the equatorial portion, the whole of the southern hemisphere being shaded over with a kind of mottled dun, almost uniformly, only a little darker near the pole; the inner edge of the bright ring was shaded off, but not quite evenly. On 22d September the appearances were much the same with power 277, except that the division of the outer ring was perhaps a little less distinct. On 27th October both the faint ring and outer division were seen with power 177; and with 277 the former could be traced up to and across the planet. Between 1st and 7th January 1853, 4 sets of measures were obtained with power 365 and 277, which are given in the Appendix, page 2, the mean results of which, reduced to Saturn's mean distance (9·5430, by Bouvard's Tables), are as follow:—

Outer diameter of outer ring, ...	39″·92
Diameter of fine division, ...	38·09
Inner diameter of outer ring, ...	35·46
Outer diameter of inner ring, ..	34·77
Inner diameter of inner ring, ...	26·55
Inner diameter of faint ring, ..	22·19
Equatorial diameter of Saturn, ..	17·86
Polar diameter of Saturn, ...	16·50

The broad division between the two old rings was not black but of an umber brown hue and the faint ring as seen across the planet had nearly the same hue, and a filmy appearance, and the planet's limb was seen through it as through a film of smoke. There was no suspicion of any other division in the outer ring besides the one above noticed and measured. Four Satellites have been frequently seen, but Japetus only on one or two occasions. On 5th January at about $2^h\ 10^m$ Sidereal time Tethys became faint and disappeared, being most probably eclipsed: the time not very exact, it was then just opposite the E. ansa, at 5^h it was seen again near Saturn's pole.

The planet has subsequently been examined from time to time with various powers, but no decided change has been perceptible in the appearance of either the faint ring or the outer division. The former never appears well defined at its inner edge, neither has its surface an uniform tint. Fig. 4 represents the planet as seen on 1st January, 1853.

22 to 24	19	26·49	7	26·90	— 0·41
	This sudden alteration of the Microscope D arises from the shoulder of the screw having worn so as to allow of the rim of the Micrometer head to rub against the zero lozenge, on the body of the Micrometer—the observations are suspended in consequence. I rectified this by filing away the edge of the Micrometer head.				T. G. T.

	The wires were frayed and covered with dus trying to shake it off and blowing gently, I o ed a separation of the vertical wire; it was br Put in a new set. The dust appears to b black of the tube of the Telescope, and also it and the oil of the Micrometer screw, as the ticles about the wire plate left a greasy black The wires are rather thick, similar to the Tran				W. K.
28	8	+ 1 46·69	2	+ 1 44·75	+
	On examining the wires found them clear firmly set, but the adjusting screw of the hori wire was *not* home, moving whilst I shade hand from the light, my hand resting on the —set it firm and re-adjusted the vertical and zontal *wires*. The following are the readings for Error:				W. K.
29	9	+ 0 54·95	3	+ 0 55·25	—

INDEX ERROR OF THE MURAL CIRCLE, *(Continued.)*

Date.	No of Obs	Index Error by Stars.	No. of Obs.	Index Error by Reflecting Collimator.	Difference.
1848.					
Mar. 29	The south friction roller Axle has worn its bearing very much away. W. K. W.				
		′ ″		′ ″	″
30	8	+ 0 54·81	5	+ 0 54·88	— 0·07
31	11	54·72	5	54·95	— 0·23
	The clamp screws below A and B reported to require repair. On examining them I found the upper clamp plate had been worn away, the circle consequently was scarcely held; the plate would not "bite." Carefully filed away the other part to lower it, to touch the limb of the circle. They now act perfectly. The screws are good enough. W. K. W.				
April 1	9	+ 0 54·45	4	+ 0 55·33	— 0·88
2	Vide remark 29th March. The bearing continues to enlarge. Lest the axis of the circle should be subjected to unequal wear, discontinued the observations, Captain Smith having kindly promised to repair the injury, after examining it and agreeing with me that it would be advisable to do so. The hole is worn ·85* larger than the Axle. Sent for repair. W. K. W.				
10	Captain Smith returned the Friction Wheels having bouched the damaged bearing with steel. Mr. R. Allan and C. Veerasawmy Pillay remarked that previous to the discovery of the damage, subsequent in fact to the last oiling in January, the divisions of the circle "were on one side" of the cross wire, and suggested that the Friction Wheels had been sustaining more than their due weight. On examining this, I found that the Circle was *not* pushed home. I put the Circle gently in and Mr. R. Allan tightened the back screws with his fingers fully "four turns." Whilst the wheels were under repair, I sent the Collimator to be adjusted and fitted. N. B.—Mr. Vincent failed to make a proper screw adjustment to the speculum until the 13th. W. K. W.

A

SUBSIDIARY CATALOGUE

OF

1440 STARS

SELECTED FROM THE

BRITISH ASSOCIATION CATALOGUE,

REDUCED TO JANUARY 1ST, 1850.

FROM

OBSERVATIONS MADE AT MADRAS,

IN THE YEARS, 1849—53.

N. B.—The Stars are arranged as usual in the order of their Right Ascension ; it therefore happens that a few of the numbers, as ven in the B. A. C., are transposed ; every such transposed number is placed between ( ) in order to catch the eye.

No. from B. A. C.	Magnitude.	Right Ascension, January 1, 1850.	Annual Precession.	Proper Motion.	No. of Observations.	North Polar Distance, January 1, 1850.	Annual Precession.	Proper Motion.	No. of Observations.	Mean Date of Observation.

* This is the mean epoch for the P. D., that for the A. R. is 1851 65.

No. from B. A. C.	Magnitude.	Right Ascension, January 1, 1850.	Annual Precession.	Proper Motion.	No of Observations.	North Polar Distance, January 1, 1850.	Annual Precession.	Proper Motion	No. of Observations.	Mean Date of Observation.

NOTES ON THE FOREGOING CATALOGUE.

In the following Notes B. refers to Brisbane's Catalogue of 7385 Stars; G. to Groombridge's Catalogue of Circumpolar Stars; B.A.C. to the Catalogue of the British Association; L.C. to Lacaille's Catalogue of 9766 Stars as reduced by Baily;—P.M. means proper motion.

No. 13 Another star of 7 magnitude precedes by $38^{s}\cdot3$ & $10''\cdot$ S.

15 The A.R. differs from Lacaille by $-6^{s}\cdot3$.

34 Comparison with B. reverses the P.M.

41 The P.M. is not confirmed either in A.R. or P.D.

76 The P.M. in A.R. is probably underrated, as the difference from Lacaille is $-1^{s}\cdot8$: that in P.D. if any, is —.

98 The proper motion is not confirmed either in A.R. or P.D.

157 The P.M. appears to be much overrated both in A.R. and P.D., the differences from Brisbane being $+0^{s}\cdot46$ and $-10''\cdot49$ respectively; there must be some error in Lacaille.

186 Is not found.

188 The P.M. in P.D. is not confirmed, that in A.R. is if any thing +, the difference from Brisbane being $+0^{s}\cdot5$ but he has only one observation.

193 Lacaille is probably in error.

276 The P.M. in A.R. is almost exactly confirmed, while that in P.D. is — instead of +.

277 The P.M. is not confirmed.

278 Not seen.

294 The P.M. in P.D. is confirmed, or is probably greater than that assigned in the B.A.C., that in A.R. appears + instead of —, but its amount is uncertain as B. has but one observation with the mural; difference from B. $+1^{s}\cdot09$; from L.C. $+0^{s}\cdot7$.

306 The P.M. in A.R. appears underrated, that in P.D. is not confirmed.

407 The P.M. in A.R. not confirmed; that in P.D. rather overrated.

417 The P.M. in A.R. is nearly confirmed, that in P.D. if any is + instead of —; difference from B $+0''\cdot9$.

434 Not seen.

450 Another star 7 magnitude precedes by $27^{s}\cdot6$, and $95''\cdot5$ N.

455 The P.M. in A.R. appears underrated.

514 The P.M. not confirmed.

531 The P.M. in A.R. nearly confirmed, that in P.D. reversed.

534 Not seen.

543 P.M. not confirmed; diff. from B. $-0^{s}\cdot38$ and $+0''\cdot7$, from L.C. $+2^{s}\cdot0$.

575 The P.M. in P.D. appears underrated.

596 Observed by mistake for 601 which was not found; the P.M. in P.D. is nearly confirmed; that in A.R. appears underrated in B.A.C.

602 Differs from L.C. by $+3^{s}\cdot6$ and $+26''\cdot5$.

642 Is not found; the nearest star 7 magnitude is in $1^{h}\ 57^{m}\ 35^{s}$ and $143^{\circ}\ 45'\ 34''$.

651 The P.M. in P.D. is not confirmed; difference from G. $+1''\cdot2$, but there is a sensible P.M. in A.R.

No. 714 The P.M. is not confirmed either in A.R. or P.D.; difference from G. $-\overset{s.}{0}\cdot33$ and $+\overset{''}{0}\cdot25$ respectively.

728 An error of $\overset{m.}{1}$ in A.R.

738 P.M. not confirmed.

779 Comparison with Brisbane would indicate that the signs of the proper motions both in A.R. and P.D. should be changed, the difference being $+\overset{s}{1}\cdot84$ and $-\overset{''}{3}\cdot93$.

795 P.M. not confirmed; difference from G. only $-\overset{s.}{0}\cdot16$ and $-\overset{''}{1}\cdot35$.

802 The large P.M. in A.R. has its sign reversed by comparison with G.; that in P.D. appears rather underrated.

814 The P.M. in A.R. is doubtful, that in P.D. nearly confirmed; diff. from G. $-\overset{s}{0}\cdot06$ and $+\overset{''}{1}\cdot16$.

841 P.M. not confirmed; diff. of A.R. from B. $+\overset{s}{0}\cdot45$, from Lacaille $+\overset{s.}{4}\cdot1$: of P.D. from B. $+\overset{''}{0}\cdot12$.

868 Comparison with B. does not confirm the P.M. in A.R. and greatly reduces that in P.D.; diff. $+\overset{s.}{0}\cdot03$ and $+\overset{''}{2}\cdot85$.

876 The P.M. in A.R. appears over-estimated; that in P.D. is if any thing — instead of +: diff. in A.R. from B. $+\overset{s.}{0}\cdot63$, from L.C. $+\overset{s.}{4}\cdot9$: in P.D. from B. $-\overset{''}{1}\cdot43$.

906 Comparison with B. indicates a considerable P.M. in A.R., but in a direction opposite to that assigned in B.A.C.: diff. from B. $+\overset{s.}{1}\cdot28$ and $-\overset{''}{2}\cdot18$.

911 The large P.M. is not confirmed; there may be a small P.M. in P.D. but little or none in A.R.; diff. from B. $+\overset{s.}{0}\cdot19$ and $-\overset{''}{3}\cdot8$. There is probably an error in Lacaille.

931, 935 Are not found.

936 A star 8·5 magnitude follows by about $\overset{s.}{0}\cdot1$ and $\overset{''}{8}\cdot5$ S.

956 Agrees exactly with B. in A.R.: diff. in P.D. $-\overset{''}{1}\cdot54$.

961 Comparison with B. shows a P.M. of an opposite sign to that in B.A.C. and no P.M. in P.D.: diff. $+\overset{s.}{1}\cdot10$ and $-\overset{''}{0}\cdot11$.

969 Is not found.

988 The P.M. in P.D. appears overrated; diff. from G. $+\overset{''}{0}\cdot95$.

1018 The same remark applies; diff. from G. $+\overset{''}{0}\cdot59$.

1036 P.M. not confirmed; diff. from B. $+\overset{s.}{0}\cdot24$ and $-\overset{''}{0}\cdot26$.

1048 The P.M. large as it is appears underrated in B.A.C. and unless there be a considerable error in L.C. that in A.R. is not uniform: diff. from B. $+\overset{s}{5}\cdot96$ and $-\overset{''}{2}0\cdot0$; from L.C. $+\overset{s}{1}5\cdot2$ and $-\overset{''}{7}4\cdot4$.

1050 The P.M. assigned is not confirmed by comparison with G. diff. $+\overset{s.}{0}\cdot42$ and $-\overset{''}{2}\cdot06$. A star $7\frac{1}{2}$ magnitude follows by $\overset{s.}{7}\cdot5$ and $\overset{''}{3}\cdot$ S.

1067 The same remark applies regarding the P.M.: diff. $+\overset{s}{0}\,41$ and $-\overset{''}{0}\cdot82$.

1072 The same remark applies: diff. $-\overset{s.}{0}\cdot24$ and $-\overset{''}{0}\,61$.

1101 The P.M. is not confirmed.

1131 The P.M. appears underrated in A.R. and overrated in P.D.; diff. from B. $+\overset{s}{0}\cdot92$ and $-\overset{''}{3}\cdot88$.

1297 The P.M. appears slightly overrated.

1412 Diff. from L.C. $+\overset{s.}{2}\cdot1$ and $-\overset{''}{3}4\cdot6$.

1427 P.M. not confirmed.

1466 The P.M. in B.A.C. appears much underrated in A.R. and overrated in P.D.; difference from B $+\overset{s}{0}\cdot91$ and $-\overset{''}{2}\cdot0$.

1489 The direction of the P.M. is reversed by comparison with B.; diff. $+\overset{s}{1}\cdot14$ and $-\overset{''}{4}\cdot06$.

1589 The same remark applies. diff. from B. $+\overset{s.}{1}\cdot70$ and $-\overset{''}{1}\cdot80$.

1612 The P.M. is over-estimated both in A.R. and P.D.; there is probably an error in L.C.; diff. from B. $-\overset{s.}{0}\cdot54$ and $+\overset{''}{4}\cdot2$.

1621 The P.M. in A.R. is reversed; that in P.D. is nearly confirmed; diff. from B. $-\overset{s.}{0}\cdot77$ and $-\overset{''}{3}\,7$.

1678, 1696 The P.M. is not confirmed.

1704 The P.M. in A.R. is underrated: the direction of that in P.D. is reversed; difference from B. $+\overset{s}{0}\cdot50$ and $-\overset{''}{5}\cdot8$.

No. 1712 The P.M. if any appears to be in a direction opposite to that assigned in B.A.C.; diff. from B. — $0^s\cdot45$ and — $0''\cdot58$. Another star of about the same magnitude precedes by $4^s\cdot0$ and $11''\cdot$ N.

1728 Both the stars were observed with the Mural circle but only the first with the Transit. The diff. of A.R. $0^s\cdot40$ was derived from the Equatorial Observations.

1729 There is probably no P.M. in A.R. but that in P.D. is nearly confirmed; diff. from B. — $0^s\cdot29$ and — $1''\cdot84$.

1752 The P.M. is not confirmed: another star of nearly the same mag. precedes by $1^s\cdot6$, and $29''\cdot$S; the pair are 10527 and 9 H.C.

1770 The P.M. in A.R. is uncertain; diff. from B + $1^s\cdot04$ and from L.C. — $0^s\cdot2$: that in P.D. has been overrated: diff. from B. — $3''\cdot24$.

1790 P.M. in A.R. uncertain; diff. from B + $2^s\cdot62$; from L.C. — $0^s\cdot4$; that in P.D. if any must have its sign reversed; diff. from B. + $1''\cdot5$.

1847 P.M. in A.R. not confirmed; that in P.D. has its sign changed: diff. from B. + $0^s\cdot27$ and — $6''\cdot36$.

1907 This star must have a considerable P.M. unless there be an error in Bessel.

1909 The P.M. in A.R. is deduced from comparison with L.C.; that in P.D. is much reduced by comparison with B.; diff. — $5''\cdot07$.

1921 The P.M. in A.R. is nearly confirmed by comparison with G.; the P.D. differs from his by only + $1''\cdot1$.

1926 The P.M. in A.R. appears to have been slightly overrated; that in P.D. is exactly confirmed; diff. from B + $0^s\cdot68$ and — $18''\cdot6$.

1927 The P.M. in A.R. is uncertain, B. having but one observation; difference from B. — $1^s\cdot24$; from L.C. + $0^s\cdot5$: that in P.D. has been slightly underrated; diff. from B. — $4''\cdot6$.

1942 The P.M. in A.R. is not confirmed; that in P.D. is derived from comparison with G.

1954 The P.M. in A.R. is reversed; that in P.D. is nearly confirmed; diff. from B. = + $0^s\cdot46$ and — $6''\cdot44$.

1999 A star 8 magnitude precedes $0^s\cdot6$ and $10''\cdot$S.

2013, 2014 P.M. not confirmed.

2018 Not found.

2021 The P.M. in A.R. is not confirmed, but that in P.D. is confirmed very nearly.

2031 Comparison with Brisbane shows a larger P.M. in A.R. than that assigned in B.A.C.; that in P.D. is also larger, but with the opposite sign; diff. — $1^s\cdot19$ and — $7''\cdot53$.

2048 The place differs very widely from Brisbane's; L.C. 2242 should probably be referred to the following star, No. 2049.

2072 P.M. in A.R. not confirmed; that in P.D. has its sign changed; diff. from B. + $0^s\cdot34$ and + $5''\cdot17$, from L.C. — $1^s\cdot8$ and — $53''$. There is probably an error in L.C.

2076 The P.M. in A.R. is not confirmed; that in P.D. has been underrated.

2078 The P.M. is nearly confirmed; diff. from B. + $1^s\cdot11$ and — $6''\cdot78$; from L.C. + $5^s\cdot2$ and — $31''\cdot4$.

2093 P.M. not confirmed; diff. from B. + $0^s\cdot24$ and — $0''\cdot18$.

2102 There must be an error in L.C. as his place is out by $4''$.

2106 The P.M. is reversed; diff. from B. — $1^s\cdot44$ and — $4''\cdot3$.

2121 There is some uncertainty about this star, the differences being from B. — $2^s\cdot98$ and — $3''\cdot08$; and from L.C. + $4^s\cdot1$ and — $27''\cdot3$.

2137 The same remark applies; diff. from B. + $0^s\cdot88$ and — $3''\cdot22$; from L.C. — $2^s\cdot5$ and + $21''\cdot8$.

2142 The same remark as above; diff. from B. — $1^s\cdot76$ and + $0''\cdot8$; from L.C. + $1^s\cdot0$ and — $7''\cdot2$; P.M. in P.D. not confirmed.

2190 Differs from B. + $0^s\cdot56$ and + $66''\cdot1$; but B. has only one observation.

2238 The A.R. in the B.A.C. is $0^s\cdot6$ in excess. The position agrees almost exactly with Lalande's as given by Baily.

No. 2284 The A.R differs + $8^{s}\cdot0$, and P.D. — $49''$ from L.C.

2288 The P.M. in A.R. is not confirmed; that in P.D. reversed; diff. from B. — $0^{s}\cdot04$ and — $6''\cdot94$.

2315 The P.M. in A.R. not confirmed; that in P.D. if any is overrated; diff. from B. = + $0^{s}\cdot03$ and — $0''\,95$.

2321 P.M. in A.R. doubtful; that in P.D. is very nearly confirmed; diff. from B. — $0^{s}\cdot38$ and $5''\cdot90$.

2360 There is some uncertainty about this star: difference from B. + $1^{s}\cdot04$ and — $1''\cdot58$; from L.C. — $2^{s}\cdot8$ and — $0''\cdot8$; but there would appear to be little or no P.M. in P.D.

2363 P.M. not confirmed.

2386 The P.M. in A.R. appears rather overrated, that in P.D. is reversed; diff. from B. — $0^{s}\cdot22$ and + $1''\cdot6$.

2399 The P.M. in A.R. seems to have been rather overrated; that in P.D. is exactly confirmed; diff. from B. — $0^{s}\cdot67$ and — $1''\cdot7$.

2408 The P.M. in A.R. has been overrated, that in P.D. is not confirmed; diff. from B. — $0^{s}\,27$ and + $0''\cdot7$.

2511 A double star in a wide cluster with a star $6\frac{1}{2}$ magnitude preceding; no nebula seen.

2528 The P.M. in A.R. is doubtful; that in P.D. nearly confirmed; diff. from B.— $0^{s}\cdot62$ and — $2''\cdot4$; from L.C. + $2^{s}\cdot6$ and — $12''\cdot5$.

2610 The P.M. appears large, but B. has only one observation; diff. — $2^{s}\cdot92$ and — $7''\cdot0$.

2615 Differs from L.C. by — $1^{s}\cdot9$ and — $9''\cdot3$.

2656 P.M. in A.R. nearly confirmed; that in P.D. reversed; diff. from B. + $0^{s}\cdot37$ and — $5''\cdot8$.

2686 Not seen.

2687 This star is preceded by 3 others of 8th mag nearly in this form ∴ •; diff of A.R. 41^{s}, 38^{s} and 27^{s}.

2688 Is the double star 88 H. and S.

2709 There is some uncertainty about this star, from B. having but one observation of A.R. and with the mural — but the P.M. in P.D. appears over-estimated—diff. from B. — $1^{s}\cdot22$ and + $2''\cdot84$ and from L.C. — $1^{s}\cdot0$ and + $27''\cdot3$.

2713 The P.M. if any in A.R. should have its sign reversed; that in P.D. is not confirmed; diff. from B. — $0^{s}\cdot48$ and — $0''\cdot48$.

2738 The P.M. is underrated; diff. from B. + $0^{s}\,98$ and — $4''\cdot4$. A star 9 magnitude precedes by $12^{s}\cdot3$ and $14''$ S.

2751 P.M. not confirmed.

2766 Is a cluster of small stars.

2768 The P.M. is greatly overrated; L.C. is probably in error, but B. has only one observation; diff. from B. — $0^{s}\cdot46$ and — $1''\cdot44$; from L.C. — $5^{s}\cdot6$ and — $11''\cdot6$.

2796 The P.M. in A.R. is not confirmed; that in P.D. is nearly so; diff. from B. + $0^{s}\cdot02$ and — $2''\cdot7$

2820 Comparison with B. reverses the direction of P.M. diff. — $0^{s}\cdot92$ and — $3''\cdot6$.

2823 Comparison with B. does not confirm the P.M. in A.R. but increases that in P.D.; diff. — $0^{s}\cdot06$ and — $5''\cdot0$.

2843 Comparison with B. reverses the P.M. in A.R. and does not confirm that in P.D.; diff. + $0^{s}\cdot98$ and — $0''\cdot1$.

2857 P.M. greatly overrated; L.C. probably in error; diff. from B. + $0^{s}\cdot23$ and — $3''\cdot9$; from L C. + $5^{s}\cdot3$ and — $12''\cdot6$

2887 Is G. 1458 and the proper motions are derived from comparison with him.

2898 Comparison with B. increases the P.M. in A.R. and does not confirm that in P.D.; diff. from B. + $0^{s}\,83$ and — $1''\cdot1$; from L.C. + $0^{s}\cdot9$ and + $3''\cdot5$.

2939 The P.M. in A.R. appears underrated; that in P.D. is not confirmed, diff. from B. + $0^{s}\,87$ and — $1''\cdot3$.

2949 P.M. not confirmed; diff. from B. — $0^{s}\cdot39$ and — $0''\cdot8$.

3007 Comparison with B. reverses the P.M. both in A.R. and P.D. diff. + $0^{s}\,99$ and + $4''\cdot7$.

3008 Comparison with B. nearly confirms the P.M. in P.D., but reverses that in A.R., but B. has only one observation; diff. — $2^{s}\cdot4$ and + $6''\cdot2$.

3028 The P.M. is derived from comparison with B. but he has only one observation.

No. 3067 Comparison with B. reverses the proper motions, but he has only one observation; diff. — $1^{s}\cdot22$ and + $15''\cdot5$, under the supposition that he observed the *following* star.

3082 P.M. not confirmed; diff. from B. + $0^{s}\cdot12$ and + $0''\cdot7$.

3103 P.M. in A.R. not confirmed.

3128 The P.M. in A.R. has been underrated, and that in P.D. overrated; diff. from B. + $0^{s}\cdot57$ and — $2''\cdot4$.

3139 A.R. agrees exactly with B.; P.D. differs + $35''\cdot2$.

3154 Diff. from B. + $1^{s}\cdot77$ and — $8''\cdot2$, but he has only one observation.

3189 Diff. from B. + $10^{s}\cdot08$ and + $7''\cdot0$, but he has only one observation, and has probably made a mistake of 10^{s}.

3233 Is not found.

3247 Cluster, no nebula seen; nearest star 8 magnitude, $9^{h}\ 22^{m}\ 42^{s}$ and $95^{\circ}\ 20'\ 51''$.

3274 The P.M. appears overrated both in A.R. and P.D.; diff. from L.C. + $3^{s}\cdot0$ and — $2''\cdot3$.

3276 Comparison with B. slightly increases the P.M. in A.R. and doubles that in P.D.; diff. + $0^{s}\cdot22$ and — $4''\cdot6$.

3316 P.M. not confirmed; diff. from B. + $0^{s}\cdot25$ and — $0''\cdot9$.

3323 P.M. in A.R. underrated; that in P.D. is reversed; diff. from B. + $0^{s}\cdot38$ and — $8''\cdot2$.

3328 Appears to be a duplicate of 3323 with an error of 1 minute in A.R.

3351 The P.M. in A.R. is overrated; that in P.D. is not confirmed; diff. from B. + $0^{s}\cdot78$ and + $0''\cdot4$.

3357 The P.M. not confirmed.

3401 Not seen.

3426 The P.M. in A.R. has been overrated; that in P.D. is not confirmed; diff. from B. + $0^{s}\cdot25$ and — $0''\cdot7$.

3454, 3461 } Not seen.

3460, 3479 } P.M. not confirmed.

3482 Not found.

3488 The P.M. in A.R. is reversed by comparison with B.; that in P.D. has been underrated; diff. + $1^{s}\cdot14$ and — $2''\cdot8$.

3513 The P.M. in A.R. not confirmed; that in P.D. reversed; diff. from B. — $0^{s}\cdot22$ and — $4''\cdot6$.

3535 Not seen.

3541 P.M. both in A.R. and P.D. reversed by comparison with B.; diff. + $0^{s}\cdot70$ and — $5''\cdot2$.

3543 P.M. in A.R. not confirmed, that in P.D. confirmed.

3547 A cluster of small stars. The P.M. appears overrated both in A.R. and P.D.; probably different stars in the cluster have been observed.

3556 P.M. not confirmed.

3564 The P.M. in A.R. is reversed; that in P.D. nearly confirmed; diff. from B. + $0^{s}\cdot43$ and — $2''\cdot4$.

3586 Not found.

3595 P.M. in A.R. not confirmed; that in P.D. confirmed nearly.

3599 P.M. in A.R. not confirmed; that in P.D. reversed; diff. from B. + $0^{s}\cdot19$ and — $3''\cdot5$.

3605 The P.M. has been underrated; diff. from B. + $0^{s}\cdot74$ and — $4''\cdot0$.

3627 P.M. not confirmed; probably an error in Lalande.

3635 P.M. in A.R. not confirmed; in P.D. doubtful; diff. from B. — $0^{s}\cdot28$ and — $0''\cdot7$.

3639 Diff. from Groombridge — $30^{s}\cdot44$ and + $3''\cdot0$; probably an error of 30^{s}. in G.

3656 P.M. not confirmed; diff. from B. — $0^{s}\cdot47$ and — $1''\cdot0$. B. has only one observation.

No. 3659 B. has only one observation and his A.R. is probably orroneous; diff. + $3^{s}\cdot56$ and + $0''\cdot9$; diff. in A.R. from L.C. — $2^{s}\cdot45$, there is probably little or no P.M.

3668 P.M. not confirmed; diff. from B. + $0^{s}\cdot22$ and — $0''\cdot1$.

3674 P.M. not confirmed.

3692 Cluster, no nebula seen.

3694 Diff. from B. — $4^{s}\cdot64$ and — $1''\cdot2$; from L.C. — $1^{s}\cdot47$ and + $14''$; an error of $5^{s}\cdot$ in B.?

3706 P.M. in A.R. not confirmed; in P.D. nearly so; diff. from B. + $0^{s}\cdot28$ and — $1''\cdot9$.

3707 A duplicate of 3706, with an error of 5^{s} in P.D.?

3716 The P.M. has been underrated in A.R., and overrated in P D.; diff. from B. — $1^{s}\cdot4$ and — $1''\cdot75$.

3717 The P.M. has been overrated in A.R., and slightly underrated in P.D.

3800 There may be a small + P.M. in A.R.: that in P.D. has been overrated; diff. from B. + $0^{s}\,26$ and + $2''\cdot7$.

3806 Comparison with B. shews a large P.M.; but he has only one observation; diff. — $1^{s}\cdot16$ and — $7''\cdot6$.

3839 P.M. not confirmed, or if any thing reversed; diff. from B. + $0^{s}\cdot15$ and — $1''\cdot7$.

3860 The large P.M. in A.R. is increased; that in P.D. reduced by comparison with B, but he has only one observation; diff. — $1^{s}\cdot94$ and — $1''\cdot8$; diff. from L C. — $5^{s}\,4$ and — $11''\cdot6$.

3880 The P.M. in A.R. is not confirmed; that in P.D. is so, very nearly; diff. from B. + $0^{s}\cdot21$ and — $1''\cdot5$.

3895 Comparison with B. reduces the P.M. in A.R. and reverses that in P.D. if any; diff. — $1^{s}\cdot16$ and — $1''\cdot2$.

3923 } The large P.M. assigned to these 2 stars are not confirmed, Lacaille's places of both must be wrong; the numbers
3924 } require to be interchanged; diff. of 3923 from B. — $0^{s}\cdot43$ and — $2''\cdot7$; of 3924 + $0^{s}\cdot11$ and — $1''\cdot4$.

3944 Is a cluster of small stars; L.C. and B. appear to have taken different stars; the large P.M. in P.D. is not confirmed.

3960 The P.M. in A.R. appears underrated; that in P.D. is not confirmed; diff. from B. + $0^{s}\cdot72$ and + $1''\cdot14$.

4010 This is G. 1830 and the large P.M. is almost exactly confirmed.

4011 The P.M. in A.R. seems rather underrated; that in P D. is not confirmed; diff. from B. — $0^{s}\,95$ and + $0''\,7$.

4041 Diff. from B. + $0^{s}\cdot90$ and + $10''\,1''\cdot4$, but he has only one observation, and has doubtless made a mistake of $10''$

4067 P.M. not confirmed; diff. from B. + $0^{s}\cdot08$ and — $0''\cdot2$.

4073 P.M. in A.R. not confirmed; that in P.D. is nearly so; diff. from B. + $0^{s}\cdot45$ and — $1''\cdot2$, but he has only one observation.

4075 P.M. in A R. not confirmed; that in P.D. reversed; only one observation of B.; diff. — $0^{s}\cdot14$ and + $2''\,3$.

4105 Comparison with B. reverses the P M.; but he has only one observation; diff. + $0^{s}\,87$ and + $1''\,7$.

4133 The P.M. in A.R. appears underrated; that in P D. not confirmed; diff. from B. — $0^{s}\cdot56$ and — $1''\cdot2$.

4146 The P.M. in A.R. if any is overrated; that in P.D. not confirmed; diff. from B. + $0^{s}\,20$ and + $1''\cdot2$.

4324 The P.M. not confirmed; diff. from B. + $0^{s}\cdot31$ and + $0''\cdot6$.

4356 P.M. in A.R. reversed; in P.D. not confirmed; diff. from B. — $1^{s}\cdot21$ and — $0''\cdot5$; probably L.C. is in error.

4370 P.M. in A.R. reversed; in P.D. not confirmed; diff. from B. + $0^{s}\cdot80$ and — $0''\cdot3$.

4381 P.M. in A.R. nearly confirmed; that in P.D. appears overrated; diff. from B. + $0^{s}\cdot18$ and + $0''\,6$.

4399 Not seen.

4410 The large P.M. is not confirmed.

4469 P.M. in A.R. not confirmed; that in P.D. has been rather underrated; diff. from B. $0^{s}\,00$ and — $2''\cdot9$.

4475 The P.M. has been underrated, and the sign of that in P.D. is changed; diff. from B. — $0^{s}\cdot95$ and — $3''\,5$.

4485 Cluster; no nebula seen.

4491 P.M. not confirmed.

4512 P.M. in A.R. reversed; in P.D. not confirmed; diff. from B. — $2^{s}\cdot98$ and — $1''\cdot3$.

No. 4524 Comparison with B. does not confirm the P.M., but he has only one observation: diff. — 0ˢ·11 and + 1″·9.

4557 P.M. not confirmed; diff. from B. — 0ˢ·02 and + 1″·6.

4558 This is a double star, and Brisbane has noted it as such, and he must apparently have observed the L.C. star, though he does not state which: the P.M. in A.R. is overrated; that in P.D. is not confirmed; diff. from B. — 0ˢ·24 and + 1″·5.

4569 Is not found.

4573 The middle star of 3 was observed. L.C. probably took the 1st, and B. appears to have observed the 2d with the mural, and 3d with the transit, there being a diff. of 3ˢ between the two; in this case there will be little or no P.M.; diff. from B. — 0ˢ·22 and + 1″·1.

4644 P.M. not confirmed; if any, reversed; diff. from B. — 0ˢ·35 and + 1″·9.

4703 P.M. in A.R. not confirmed, in P.D. reversed: diff. from B. — 0ˢ·28 and — 9″·0.

4732 The P.M. in A.R. is reversed; that in P.D. has been underrated; diff. from G. — 0ˢ·58 and + 4″·7.

4740 The P.M. in A.R. is nearly confirmed; that in P.D. has been rather underrated: diff. from B. — 0ˢ·55 and — 6″·4; but B. has only one observation.

4844 P.M. in A.R. doubtful; that in P.D. not confirmed; diff. from B. — 0ˢ·57 and — 0″·1.

4860 The large P.M. in A.R. is not confirmed.

4887 The P.M. in A.R. has been underrated; that in P.D. is reversed; diff. from B. — 0ˢ·83 and — 5″·6.

4899 The P.M. appears to have been slightly underrated: diff. from B. — 0ˢ·76 and — 1″·2.

4908 The P.M. in A.R. is reversed; that in P.D. nearly confirmed; diff. from B. — 1ˢ·20 and — 1″·5.

4912 The P.M. in A.R. is not confirmed, in P.D. doubtful; diff. from B. + 0ˢ·01 and — 52″·1; from L.C. + 0ˢ·4 and — 9″·0; perhaps B. has made an error of 1′; he has only one observation.

4921 The P.M. in A.R. is confirmed; but not in P.D.

4938 The P.M. in A.R. is nearly confirmed: that in P.D. has been overrated: diff. from B. — 0ˢ·37 and — 1″·1.

4968 The A.R. is 1ᵐ in error.

4979 Differs from L.C. by — 14ˢ and — 6′.

4980 P.M. in A.R. somewhat overrated; in P.D. none: diff. from G. — 0ˢ·62 and + 0″·03.

4983 Is not found.

5007 Comparison with B. increases the P.M. in A.R., and reverses that in P.D.; diff. — 0ˢ·64 and — 2″·1.

5025 Is not found.

5040 Cluster of stars of 7 and 8 mag.; P.M. not confirmed; B. has but one observation; diff. + 0ˢ·23 and — 0″·8.

5042 P.M in A.R. overrated: in P.D. not confirmed; diff. from B. — 0ˢ·43 and — 1″·3.

5045 Diff. from B. — 1ˢ·04 and + 4″·5.

5049 The P.M. in A.R. is not confirmed; that in P.D. is nearly so.

5080 P.M. in A.R. not confirmed; in P.D. reversed; diff. from B. + 0ˢ·19 and — 3″·9.

5081 P.M. in A.R. nearly confirmed; in P.D. not so; diff. from B. — 0ˢ·78 and + 1″·1.

5101 P.M. in A.R. doubtful; that in P.D. is reversed; diff. from B. — 0ˢ·30 and — 5″·1.

5106 Comparison with B. reverses the P.M. in A.R., and increases that in P.D.; diff. + 0ˢ·65 and + 3″·2.

5111 A double star, components nearly equal. S. 673.

5114 The P.D. is in error 5′.

5117 The N.P.D. should be 114°·36′. Taylor being right.

5137 The P.M. in A.R. is underrated, and in P.D. overrated: diff. from B. — 0ˢ·36 and + 4″·3.

5162 Is not found.

5170 P.M. in A.R. (if any) has been overrated; that in P.D. is not confirmed; diff. from B. — 0ˢ·14 and — 0″·3.

No. 5174 The P.M. in A.R. is nearly confirmed; that in P.D. reversed; diff. from B. — $0^s.34$ and — $2''.9$; but he has only one observation.

5179 There is probably little or no P.M.; B. has only one observation; diff. — $1^s.12$ and + $2''.7$.

5182 The same remark applies; diff. from B. — $1^s.26$ and — $1''.4$.

5183 The P.M. in A.R. has been overrated; that in P.D. is reversed; diff. from B. — $0^s.50$ and + $2''.6$.

5186 The P.M. in A.R. is nearly confirmed; that in P.D. reversed; diff. from B. — $1^s.13$ and + $4''.1$.

5193 The P.M. in A.R. (if any) has been overrated; that in P.D. is not confirmed; diff. from B. + $0^s.16$ and — $1''.2$.

5200 Comparison with Brisbane and Taylor gives nearly the same P.M. in A.R.; while the P.D. is intermediate between the two.

5202 P.M. in A.R not confirmed; that in P.D. has been slightly overrated; diff. from B. + $0^s.07$ and + $7''.5$.

5209 P.M. not confirmed: diff. from B. + $0^s.02$ and — $1''.1$.

5213 P.M. reversed: diff. from B. + $0^s.37$ and — $4''.1$.

5217, 5218 } P.M. not confirmed.

5225 The P.M. in A.R. has been underrated; that in P.D. is reversed. diff. from B. — $1^s.19$ and — $3''.0$.

5229 Probably no P.M.; diff. from B. + $0^s.37$ and + $1''.3$.

5231 P.M. in A.R. not confirmed; in P.D. reversed; diff. from B — $0^s.13$ and — $4''.9$.

5241 Is not found; probably a duplicate of 5247.

5247 P.M. in A.R. not confirmed.

5256 Comparison with B. reverses the P.M.; diff. — $0^s.72$ and + $1''.1$.

5261 P.M. in A.R. reversed: in P.D. confirmed; diff. + $0^s.81$ and + $1''.3$.

5263 P.M. not confirmed; diff. from B. + $0^s.08$ and + $0''.8$.

5288 Differs from L.C. + $4^s.6$ and + $4''.5$.

5300 A wide cluster of stars of 7 and 8 mag.; P. M. not confirmed; diff. from B. — $0^s.04$ and — $0''.2$; B. and L.C. have probably observed different stars.

5301 P.M. perhaps underrated in A.R. and overrated in P.D.; but B. has only one observation diff. — $1^s.45$ and + $3''.4$

5305 P.M. in A.R. exactly confirmed; that in P.D. (if any) reversed; diff. from B. + $0^s.43$ and — $1''.0$, but he has only one observation.

5308 The P.M. in A.R. has been underrated: that in P.D. is reversed; diff. from B. + $0^s.95$ and + $3''.8$.

5323 Comparison with B. reverses the P.M. (if any); but he has only one observation; diff. — $0^s.81$ and — $1''.7$.

5349 Not found; perhaps a duplicate of 5350.

5353 P.M. in A.R. reversed; in P.D. not confirmed: diff. from B. — $1^s.20$ and + $0''.1$; L.C. is probably in error.

5370 P.M. in A.R. somewhat overrated, that in P.D. confirmed: diff. from B. + $0^s.30$ and + $3''.9$.

5372 B. has only one observation and his A.R. is probably in error. diff. + $3^s.51$ and + $0''.4$.

5389 Differs from L.C. + $6'$ in P.D.

5402 The P.M. in A.R. is not confirmed, and that in P.D. appears overrated; diff. from B. + $0^s.29$ and + $2''.8$.

5415 Not found; nearest star 6 mag. is in $16^h\ 6^m\ 59^s$ and $31^\circ\ 40'\ 11''$.

5424 P.M. reversed; diff. from B. + $1^s.03$ and — $1''.6$.

5454 The P.M. in A.R. is nearly confirmed; that in P.D. has been underrated; diff. from B. — $0^s.28$ and — $3''.9$.

5459 G. appears to have made an error of $1'$ in the P.D.

5470 Is a cluster of small stars, and B. and L.C. have probably taken different ones.

5482 Is not found.

5485 P.M. not confirmed; diff. from B + $0^s.17$ and +. $1''.8$.

No. 5486 P.M. in A.R. not confirmed; in P.D. nearly so; diff. from B. + $0^{s}.09$ and — $2''.3$.

5487 Comparison with B. reverses the P.M. in A.R. and greatly increases that in P.D.; but he has only one observation.

5491 Not found.

5505 P.M. not confirmed: diff. from B. — $0^{s}.06$ and — $1''.4$.

5524 Is not found.

5540 The P.M. in A.R. is not confirmed; the diff. from L.C. being only — $0^{s}.76$: that in P.D. is overrated; diff. from B. — $4^{s}.81$ and + $2''.2$, but he has only one observation and has probably made a mistake of 5^{s}.

5543 The P.M. though small is nearly confirmed: diff. from B. — $0^{s}.32$ and + $0''.8$.

5564 Differs from L.C. — $3^{s}.5$ and — $9''.4$.

5570 Differs from L.C. + $5^{s}.8$ and + $5''.7$.

5612 Differs from L.C. — $4^{s}.5$ and — $12''.3$.

5613 P.M. in P.D. (if any) reversed: diff. from B. — $0^{s}.21$ and — $2''.4$.

5636 Comparison with B. increases the P.M. in A.R. and negatives that in P.D.; but he has only one observation; diff. — $1^{s}.21$ and — $0''.2$.

5657 P.M. not confirmed: diff. from B. — $0^{s}.03$ and + $0''.5$.

5662 Not found.

5665 Not found. There is a star of 8 magnitude in $16^{h}\ 44^{m}\ 33^{s}$ and $120^{\circ}\ 29'\ 58''$.

5672 Not found.

5673 Two stars were observed, neither of which agrees well with Lacaille's place.

5685 Not found.

5699 P.M. in A.R. reversed; but B. has only one observation; that in P.D. not confirmed; diff. — $1^{s}.36$ and — $0''.1$.

5707 Not found.

5715 The P.M. in A.R. is not confirmed, that in P.D. is nearly so, small as it is; diff. from B. + $0^{s}.19$ and + $0''.66$.

5722 Differs from B + $3^{s}.87$ and — $78''.3$; but he has only one observation.

5725, 5738, 5741 Not found.

5751 Comparison with B. reverses the P.M. (if any); diff. — $0^{s}.34$ and — $2''.0$.

5754 The P.M. in A.R. is confirmed, that in P.D. appears somewhat overrated.

5764 The P.M. in A.R. has been overrated; that in P.D. is reversed; diff. from B. — $0^{s}.25$ and + $2''.6$.

5770 Is not found; it is perhaps a duplicate of 5772, the P.M. of which has been overrated.

5805 The P.M. in A.R. is reversed; that in P.D. has been overrated; diff. from B. + $0^{s}.60$. and + $3''.8$, but he has only one observation.

5806 The P.M. in A.R. is doubtful, that in P. D. has been much overrated; diff. from B. — $0^{s}.35$ and + $1''.8$.

5812, 5815 The P.M. is not confirmed.

5816 Is not found; perhaps a duplicate of the preceding.

5819 Diff. from B. — $6^{s}.20$ and + $3''.1$; the large diff. in A.R. is unaccountable.

5825 The large P.M. in A.R. is almost exactly confirmed; that in P.D. has been overrated: diff. from B. + $2^{s}.79$ and + $2''.9$.

5849 Not seen.

5859 The P.M. in A.R. is much overrated, that in P.D. is reversed; diff. from B. — $0^{s}.27$ and — $4''.0$.

5870 The P.M. in A.R. is nearly confirmed; but not in P.D.; diff. from B. — $0^{s}.38$ and — $0''.1$.

5872 The same remark applies; diff. from B. — $0^{s}.38$ and + $0''.5$.

5875 The P.M. is not confirmed: diff. from B. + $0^{s}.03$ and + $1''.2$; but he has only one observation.

No. 5879 Differs from L.C. by $-10^{s.}$ and $+4'$.

5889, 5895 } P.M. not confirmed.

5897 The large P.M. in P.D. is not confirmed, the place agreeing very nearly with L.C.; B. has probably made a mistake of $1'$, he had but one observation: diff. from B. $-0^{s.}\cdot72$ and $+58''\cdot9$; from L.C. $-0^{s.}\cdot7$. and $+9''$.

5898 Differs from L.C. $-66^{s.}\cdot0$ and $+194''$.

5916 L.C. is probably in error; diff. $-8^{s.}\cdot0$ and $+243''$.

5923 No star is found in the place assigned, but there are several stars of 8th magnitude in the neighbourhood.

5924 The P.M. (if any) is reversed; diff. from B. $+0^{s.}\cdot63$ and $-1''\cdot4$; but he has only one observation.

5928 Not found.

5938 Comparison with B. reverses the P.M. in A.R. and much reduces that in P.D.; but he has only one observation; diff. $+1^{s.}\cdot39$ and $+1''\cdot4$.

5965 The P.M. is reversed; diff. from B. $+0^{s}\cdot98$ and $-3''\cdot0$.

5969 P.M. not confirmed.

5977 Differs from L.C. $+3^{s}\cdot4$ and $+8''\cdot8$.

6000 The P.M. in A.R. is not confirmed; that in P.D. reversed; diff. from B. $-0^{s.}\cdot16$ and $-12''\cdot3$.

6011 Differs from L.C. $-6^{s.}\cdot7$ and $-152''$.

6032 Differs from L.C. $-6^{s.}\cdot2$ and $-140''$.

6055 P.M. not confirmed: diff. from B. $+0^{s.}\cdot22$ and $0''\cdot0$.

6090 P.M. in A.R. nearly confirmed; in P.D. reversed; diff. from B. $-0^{s}\cdot21$ and $-4''\cdot1$.

6100 Comparison with B. negatives the P.M. in A.R. but doubles that in P.D.; diff. $+0^{s}\cdot07$ and $+3''\cdot0$.

6132 A star 8 magnitude follows by about $1^{s.}$.

6136 Comparison with B. greatly reduces the P.M. in A.R. and reverses that in P.D.: diff. $-0^{s.}\cdot46$ and $+2''\cdot9$.

6148 Comparison with B. reverses the P.M.; diff. $+0^{s.}\cdot84$ and $-0''\cdot9$.

6163 A star 9 magnitude precedes by 6^{s}, and $6''$N.

6165 There appears an error of 30^{s} in Lalande's A.R.

6170 Comparison with B. reverses the P.M. in A.R.; and greatly reduces that in P.D.; diff. $+1^{s.}\cdot47$ and $+1''\cdot7$.

6173 Differs from L.C. $-7^{s}\cdot4$ $+232''$.

6201 A wide cluster, no nebula seen.

6207 Comparison with B. reverses the P.M. but he has only one observation; diff. $+0^{s.}\cdot42$ and $+3''\cdot1$.

6212 Differs from L.C. $-7^{s.}\cdot6$ and $-7''\cdot7$.

6219 Differs from B. $+7^{s.}\cdot75$ and $+1''\cdot0$; but he has only one observation.

6288 The P.M. in A.R. appears underrated; that in P.D. is not confirmed.

6303 There appears to have been an error of $30^{s.}$ in the A.R.

6328 Comparison with B. increases the P.M. in A.R. and negatives that in P.D.; diff. $-0^{s.}\cdot92$ and $+0''\cdot7$.

6337 Comparison with B. reverses the P.M. in A.R. and negatives that in P.D.; diff. $-1^{s}\cdot06$ and $+0''\cdot1$.

6374 Differs from L.C. $+2^{s}\cdot4$ and $+93''$.

6410 P.M. not confirmed; diff. from G. $+0^{s.}\cdot22$ and $-1''\cdot7$.

6425 Comparison with B. reverses the P.M. in A.R., and does not confirm that in P.D.; diff. $+1^{s}\cdot09$ and $+1''\cdot3$.

6469 The P.M. in A.R. appears to have been underrated, and that in P.D. overrated.

6472 P.M. not confirmed: diff. from B. $+0^{s}\cdot25$ and $+0''\cdot1$.

6481 Comparison with B. reverses the P.M. in A.R., and negatives that in P.D.; but he has only one observation: diff. $+0^{s.}\cdot74$ and $+1''\cdot5$.

No. 6542 Is not found; nearest star 6 magnitude in $19^{h}\ 0^{m}\ 22^{s}\cdot8$ and $65^{\circ}\ 58'\ 40''\cdot3$.

6571 P.M. not confirmed. A star 7 magnitude, follows by $1^{s}\cdot0$ and $2'\cdot\ 29''$ N.

6578 Lacaille's A.R. is 1^{m} wrong.

6579 This is a double star, H. and S. 290. The places of both are given. The pair appears to have a large P.M. but the exact amount cannot be assigned as it is not known which of the two was observed by G.

6725 Not seen.

6757 Comparison with B. somewhat reduces the P.M. in A.R. and negatives that in P.D.; but he has only one observation; diff. $+\ 0^{s}\cdot86$ and $-\ 1''\cdot3$.

6770 Not seen: nearest star $19^{h}\ 38^{m}\ 29^{s}$ and $118^{\circ}\ 51'$.

6775 Not found: there is a star of $6\frac{1}{2}$ mag. in $19^{h}\ 39^{m}\ 50^{s}$ and $119^{\circ}\ 9'\ 10''$, and one of $8\frac{1}{2}$ mag. in $19^{h}\ 39^{m}\ 19^{s}$ and $119^{\circ}\ 15'\ 58''$.

6813 Comparison with G. reverses (if any thing) the P.M. in A.R. and nearly confirms that in P.D.; diff. $-\ 0^{s}\cdot30$ and $-\ 4''\cdot8$.

6835 This star is noted as double.

6855 P.M. not confirmed.

6898, 6917 Not found.

6941 P.M. not confirmed.

6945 Comparison with B. reverses the P.M. in A.R. and does not confirm that in P.D.; diff. $+\ 0^{s}\cdot88$ and $-\ 1''\cdot4$.

6954 P.M. in A.R. not confirmed: that in P.D. has been underrated.

6960 P.M. not confirmed.

6961 Comparison with B. increases the P.M.; diff. $+\ 1^{s}\cdot05$ and $+\ 4''\cdot5$.

6984 Two nearly equal stars differing considerably from Lacaille's place.

6986 P.M. not confirmed; diff. from G. $-\ 0^{s}\cdot13$ and $-\ 0''\cdot5$

6996 The P.M. in A.R. is not confirmed; that in P.D. though small is nearly confirmed; diff. from G. $-\ 0^{s}\cdot28$ and $-\ 1''\cdot0$.

7006 P.M. not confirmed.

7037 Comparison with G. reverses the P.M. in P.D.

7056 The P.M. has been much overrated; diff. from B. $-\ 0^{s}\cdot22$ and $+\ 4''\cdot3$.

7074 The same remark applies; diff. from B. $-\ 0^{s}\cdot43$ and $+\ 3''\cdot4$.

7082 Comparison with B. increases the P.M. in A.R. and reverses that in P.D.; diff. $+\ 1^{s}\cdot05$ and $-\ 6''\cdot3$.

7095 The P.M. appears overrated.

7104 The P.M. is overrated in A.R., and underrated in P.D.

7142 The P.M. in A.R. appears underrated; that in P.D. is not confirmed.

7150 P.M. not confirmed.

7163 Rumker's A.R. must be 2^{m} in error.

7180 The P.D. differs $-\ 5'\cdot\ 40''$ from L.C. A star $8\frac{1}{2}$ magnitude precedes by 4^{s} and $4'\cdot\ 20''$ N.

7203 Not found; probably a duplicate of 7210 with an error of 1^{m}.

7214 Not found; probably a duplicate of 7225 with an error of 1^{m}.

7259 Comparison with G. confirms the small P.M. in A.R.; diff. $+\ 0^{s}\cdot23$ and $-\ 2''\cdot1$.

7268 Lalande's A.R. appears to be erroneous.

7290, 7295 P.M. not confirmed.

7307 Comparison with B. reverses the P.M. in A.R.; and greatly reduces that in P.D.; + diff. $+\ 2^{s}\cdot39$ and $+\ 2''\cdot5$.

7327 A star of $7\frac{1}{2}$ magnitude precedes by $11^{s}\cdot7$ and $3'\cdot\ 56''$ S.

7341 P.M. not confirmed.

No. 7347 There is probably an error in L.C.; the nearest star differs $-\overset{s.}{9}\cdot8$ and $+\ 280''$ from his place.

7348 The P.M. in A.R. appears underrated; that in P.D. is not confirmed.

7417 A star $6\frac{1}{2}$ magnitude precedes by $114^{s}\cdot9$ and $26''\cdot3$ S.

7457 A thin cluster of stars of 8th and 9th magnitude; B. and L.C. have observed different stars, and B. has probably observed different stars with the Transit and Mural.

7467 Is not found: no doubt it is identical with 7466.

7472 P.M. nearly confirmed.

7483 A star 7 magnitude precedes by $26^{s}\cdot8$ and $82''$ S.

7531 Comparison with B. reverses the P.M. in A.R., and negatives that in P.D.; diff. $+\ 0^{s}\cdot65$ and $-\ 0''\cdot3$.

7532 Comparison with B. reverses the P.M.; diff. $+\ 0^{s}\cdot65$ and $+\ 10''\cdot1$.

7564 Comparison with G. negatives the P.M. in A.R.; and reverses that in P.D.; diff. $-\ 0^{s}\cdot07$ and $+\ 3''\cdot2$.

7576 Is not found; it is perhaps a duplicate of 7575 with an error of 2° in P.D.

7594 If there be no error in B. the large P.M. in A.R. must be increased, but that in P.D. is reversed; diff. $-\ 4^{s}\cdot69$ and $+\ 5''\cdot1$.

7609 Comparison with B. reverses the P.M.; diff $+\ 0^{s}\cdot91$ and $-\ 1''\cdot0$.

7624 Comparison with B. reduces the P.M. in A.R. and reverses that in P.D.; but he has only one observation; diff. $-\ 0^{s}\cdot27$ and $+\ 1''\cdot7$.

7631 G. has apparently made an error of 10^{s} in A.R. The P.M. in P.D. is not confirmed; diff. $-\ 10^{s}\cdot18$ and $-\ 1''\cdot0$. Another star $6\frac{1}{2}$ magnitude precedes by $0^{s}\cdot5$ and $17''$ S.

7667 P.M. in A.R. doubtful; in P.D. not confirmed.

7699 Comparison with G. negatives the P.M. in A.R., but shews a large one in P.D.: it is noted as double; the companion 7 magnitude preceding about 1^{s}.

7717 The P.M. in A.R. is confirmed.

7734 The P.M. in A.R. is nearly confirmed, but not that in P.D.

7754 Comparison with G. confirms the P.M. nearly; diff. $+\ 0^{s}\cdot76$ and $-\ 7''\cdot5$.

7760 Comparison with G. negatives the P.M. in A.R. but nearly confirms that in P.D.; diff. $-\ 0^{s}\cdot16$ and $-\ 3''\cdot6$.

7769 Differs from L.C. $+\ 5^{s}\cdot0$ and $+\ 7''\cdot0$.

7810 Another star follows by $0^{s}\ 93$, nearly on the parallel; the pair form the double star H. and S. 843.

7834 The P.M. in A.R. is nearly confirmed, but not that in P.D.

7841 Comparison with B. reverses the P.M., diff. $+\ 1^{s}\cdot39$ and $-\ 2''\cdot2$.

7876 The P.M. has been slightly overrated; diff. from G. $+\ 0^{s}\cdot83$ and $-\ 6''\cdot4$.

7877 P.M. not confirmed.

7878 Comparison with G. considerably reduces the P.M.: diff. $+\ 0^{s}\cdot52$ and $-\ 3''\cdot4$.

7953 P.M. not confirmed.

7956 The P.M. in A.R. (if any) is overrated, that in P.D. is not confirmed; diff. from B. $-\ 0^{s}\cdot14$ and $+\ 0''\cdot2$.

7968 P.M. not confirmed.

8000 The P.M. appears underrated in A.R., and overrated in P.D.

8011 The A.R. agrees exactly with L.C. but differs $+\ 2^{s}\cdot09$ from B. who may be in error, as he has but one observation with the Mural. The P.M. in P.D. is reversed; diff. from B. $-\ 4''\cdot1$.

8018 The P.M. is not confirmed.

8042 Is not found; nearest star 7 magnitude in $23^{h}\ 1^{m}\ 55^{s}\ 3$ and $154^{\circ}\ 0'\ 7''$.

8056 P.M. not confirmed.

No. 8096 The P.M. in A.R. is perhaps overrated; that in P.D. is not confirmed.

8101 A star 9 magnitude precedes by $\overset{s.}{5}$ and $\overset{''}{4}\cdot5$ N.

8107 The P.M. is nearly confirmed; diff. from G. + $\overset{s.}{0}\cdot28$ and + $\overset{''}{9}\cdot9$.

8140 P.M. in A.R. doubtful; that in P.D. is reversed: diff. from B. + $\overset{s.}{0}\cdot24$ and — $\overset{''}{4}\cdot2$.

8147 The P.M. is nearly confirmed.

8158 The P.M. in P.D. is reversed; diff. from G. + $\overset{s.}{0}\cdot31$ and — $\overset{''}{2}\cdot1$.

8164 Differs from L.C. — $\overset{s.}{12}\cdot5$ and — $190''$. His place is probably erroneous.

8165 Comparison with B. greatly reduces (if any) the P.M. in A.R., and negatives that in P.D.; diff. — $\overset{s.}{0}.21$ and + $\overset{''}{0}\cdot6$.

8166 Comparison with B. reverses the P.M. in A.R. but nearly confirms that in P.D.; diff. + $\overset{s.}{0}\cdot61$ and — $\overset{''}{6}\cdot8$.

8173 Comparison with G. reverses the P.M. in P.D.; diff. + $\overset{s.}{0}\cdot48$ and — $\overset{''}{2}\cdot8$.

8176 Comparison with B. negatives the P.M. in A.R. and reverses that in P.D.; diff. + $\overset{s.}{0}\cdot12$ and — $\overset{''}{2}\cdot7$.

8181 The P.M. appears underrated.

8207 Comparison with B. negatives the P.M. in A.R. and increases that in P.D.; diff. + $\overset{s}{0}\cdot29$ and — $\overset{''}{7}\cdot4$.

8226 Comparison with B. negatives the P.M. in A.R. and reverses that in P.D.; diff. + $\overset{s.}{0}\cdot24$ and — $\overset{''}{2}\cdot7$.

8235 The P.M. in A.R. appears overrated; that in P.D. is not confirmed: the star is perhaps variable as the estimated magnitudes vary from $6\frac{1}{2}$ to 10.

8247 The P.M. is not confirmed.

8253 The P.M. in A.R. is nearly confirmed; that in P.D. is underrated; diff. from B. — $\overset{s.}{0}\cdot72$ and — $\overset{''}{6}\cdot7$. A star $7\frac{1}{2}$ magnitude follows by $\overset{s.}{5}\cdot4$ and $\overset{'}{4}$ N.

8260 The P.M. in A.R. is not confirmed, the difference from L.C. being only + $\overset{s.}{1}\cdot3$; that in P.D. is overrated. Rumker has probably made an error of $\overset{s.}{10}$.

8272 A star $7\frac{1}{2}$ magnitude follows by $\overset{s.}{6}\cdot4$ and $3\frac{1}{2}$ S.

8278 The P.M. is not confirmed; B. has only one observation, and has probably made an error of $\overset{s.}{5}$; diff. + $\overset{s.}{4}\cdot26$ and + $\overset{''}{0}\cdot4$.

8294 The P.M. has been overrated in A.R.; and underrated in P.D.

8306 The P.M. appears rather underrated in A.R., and overrated in P.D.; diff. from L.C. + $\overset{s.}{1}\cdot1$ and — $\overset{''}{12}\cdot7$.

8320 The P.M. is not confirmed.

8325 The P.M. is doubtful.

8340 P.M. not confirmed.

8347 The P.M. in P.D. has been overrated.

8371 The P.M. is not confirmed.

MEAN PLACES

OF

97 PRINCIPAL FIXED STARS,

FROM

OBSERVATIONS MADE AT THE MADRAS OBSERVATORY,

IN THE YEARS 1848—52,

REDUCED TO JANUARY 1ST, 1850.

OBSERVATIONS

OF

144 DOUBLE OR MULTIPLE STARS,

MADE AT THE

MADRAS OBSERVATORY,

WITH THE

LEREBOURS EQUATORIAL,

IN

1850—52.

N. B.—The references in the column of Synonyms are as follow:—S refers to the Observations by Sir J. South, and H & S to those by Herschel and South, published in the Phil. Trans. for 1824 and 26; B to the Brisbane Catalogue of Southern Stars; Δ to Dunlop's Catalogue of 253 double Stars, Mem. Ast. Soc. Vol III., h to the various Catalogues of Observations by Sir J. Herschel published in Mem. Ast. Soc., and in his "Results of Observations at the Cape of Good Hope," Σ to the second or great Dorpat Catalogue; j to the Poona Catalogue, published in 17th Vol. Mem. Ast. Soc. In the columns of weights and magnitudes an accent signifies an additional half.

4 Stars flaring.
7 Definition excellent—Wind Light S.W.
15 Difficult, B seen only by fits—sky hazy.
17 Position may be 214°.
24 Stars crawling.
38 Stars moulding.
39 Crawling and faint.

43 Taken with diagonal prism.
54 Barely separated.
55 In contact.
56 Sky hazy.
58 Definition excellent.
68 B. seen plainly with 123, but, with 200, only by glimpses.
78 Rather difficult, B. being frequently obscured by light clouds.
81 The stars will not bear illumination; the observation was taken on the thick wire.
82 Tolerably distinct, the full aperture being used.

85 *Observed diff. decn. 329″·24.
86 *Observed diff. decn. 328″·18.
99 B. seen by glimpses.
108 Taken with full aperture; will scarcely bear illumination.
110 This is the pair marked D.E. in Smith's Cycle.
112 Taken with triangular aperture.
113 do. do.
118 Barely divided, nearly equal.
120 Taken with full aperture; blazy.
121 Triangular aperture.

131 If this be *h* 3858, of which there can be little doubt, there would seem to be an error of 1° in Herschel's P D.

133 Sky hazy, and the measures rather wild.

145 Observed just before occultation by the Moon.

148 Sadly blurred, no measure of distance could be taken.

* Distance measured by repetition.

216 Set the circle at 129° which was pronounced quite intolerable.

219 Stars nearly equal.

220 *A* flaring and moulding, *B* seen by glimpses., the distance could not be taken.

235 Position set to 272° and pronounced intolerable.

250 Fine star, components nearly equal.

441 Measured with full aperture.
447 Rather difficult from the faintness of B which does not bear a full illumination.
468 Position 114° ? Stars nearly equal.
470 Definition superb.
483 Nearly equal.

251 The angle is progressing steadily at the rate of 0°·36 per annum, distance constant

252 The retrograde motion is confirmed and the distance continues to decrease.

254 Perhaps a small retrogression in position.

255 Little or no change, distance perhaps increased.

257 This star presents some anomalies; my observations show no change in 5 years, while they differ from Herschell's by 7°.

258 Position retrograding about 2° per annum, distance steady.

259 Position seems to have advanced.

261 The angle is decidedly though slowly receding, and the distance decreasing; the orbit (apparent) must be highly elongated.

263 Unchanged

267 a, daylight observations; b, night do.

269 The stars would seem to have opened a little since Herschell's Cape Observations, but the angle can have changed little if any thing.

* The Numbers are carried on from the Poona Catalogue published in 17th Volume of Memoirs of Royal Astronomical Society.

270 The position appears to have advanced about $0^{\circ}5$ per annum and the distance to have slightly increased.

271 Position unchanged; distance perhaps decreased.

272 No apparent change.

273 Do.

274 Perhaps a small advance.

275 Distance perhaps decreased.

279 Little or no change.

281 Position advancing nearly $0^{\circ}8$ per annum.

282 The distance seems to have increased.

283 Perhaps a small change in position.

284 Unchanged.

292 Position and distance seem both to have decreased.

293 Little or no change; distance perhaps decreased.

294 An evident advance of nearly $0^{\circ}7$ per annum, though the differences are not so regular as might be desired, diff. from Dunlop + $2^{\circ}4$, from Herschell + $1^{\circ}0$.

296 In the Poona Memoir (Ast. Soc. Vol. XVII.) the distance of AB is given at $95''80$, but if an error of 1 rev. of the micrometer be admitted it will be $127''16$.

307 *a* daylight observations ; *b* night do.
310 Perhaps a small change.
314 There is a 4th Star of 12th mag. position 350°, distance 80″ from B, as estimated from diagram.
318 The stars seem to have closed a little since Herschell's Cape Observations.
320 Little or no change in five years.

321 On the whole there appears to be no change, though the differences are large, for so easy a star.

322 Unchanged.

323 Probably no change, though the distance may have decreased a little.

324 Unchanged.

326 This pair has advanced in position more than 20° since 1837, with very little change of distance; but the change is probably due to the proper motion of A.

330 These stars seem to be opening, but the angle is little altered.

331 The angle has advanced and the distance increased.

333 The angle has advanced and the distance decreased.

334 Remarkably coincident with the observations in 1847.

337 The observations present considerable anomalies for so easy a star, but on the whole, it appears to have undergone little or no change: the magnitude of B is probably underrated, though it would seem to be somewhat variable.

341 Perhaps a small advance in position, and the distance apparently decreased.

342, 343, 344 Little or no change.

345, 346, 347 Little or no change.

349 The advance in position continues with accelerated speed, but the rate of approach in distance appears to be slackening, so that the stars will probably come to *a* minimum (but not *the* minimum) of distance in the course of another year or two, the true periastre will not be arrived at before 1858 or 60.

350 There is perhaps a small advance in position and decrease of distance.

351 Position may be 108°;—there appears little or no change.

353 The same remark as 350.

354 Little or no change since the discovery in 1847.

355 Little or no change.

357 The slow recess in position continues, and the distance is decreasing.

358 There is a trace of parallax shewn here which subsequent observations confirm.

360 Little or no change.

a Daylight observations; *b* night do.

						16	30	38·8	S

A. with 5 feet Achromatic power 60 —— S. with 45 inch Telescope power 55.

I lost the commencement of the Eclipse owing to dew condensing on the object glass; Mr. R. Allan at the 5 feet remarks the same "as well as on account of the shadow being ill defined and confused." I resigned the Telescope to C. Sashoo Iyengar. The object glasses of both Telescopes were repeatedly wiped. Observations generally very unsatisfactory.

W. K. WORSTER, Captain, *Acting Astronomer.*

OBSERVATION OF THE ECLIPSE OF THE MOON, ON THE 8TH MARCH, 1849.

	Madras Mean Time			Observer.		Madras Mean Time.			Observer.
	h.	*m.*	*s.*			*h.*	*m.*	*s.*	
Covers of a bright spot	17	22	33.8	A	Touches Mare Vaporum	17	33	46·0	A
Covers Keplerus	17	23	33·7	„	Touches Palus Somni	17	39	30·7	„
Touches Mare Nectaris	17	32	2·3	„	Touches Mare Serenitatis	17	47	9·3	„

Observed with the 5 feet Achromatic, power 60.

Flying clouds prevented the commencement of the Eclipse being observed and during the whole time rendered the observations unsatisfactory. The above are the only ones worthy of record, but are still of doubtful value.

* Flying clouds.

OBSERVATION OF THE ECLIPSE OF THE MOON ON THE 2ND SEPTEMBER, 1849.

	Madras Mean Time.			Observer.		Madras Mean Time.			Observer.
	h.	*m.*	*s.*			*h.*	*m.*	*s.*	
Leaves Eudoxus	11	43	46·7	A	End of the Eclipse	11	55	5·8	A
Do. Lacus Somniorum	11	45	32·4	,,					

Observed with the 5 feet Achromatic, power 60.

The time of beginning could not be noted, or the spots observed, as it was cloudy throughout the Eclipse, except for a short time when the clouds having moved away a little, the above observations were made. The Umbra not being very well defined, but somewhat confused with the Penumbra, the observations are unsatisfactory and cannot be depended upon.

OBSERVATION OF THE ECLIPSE OF THE SUN, ON THE 11TH AND 12TH FEBRUARY, 1850.

	Madras Mean Time.				Observer	Telescope.	Power.
	d.	*h.*	*m.*	*s.*			
Beginning of the Eclipse	11	22	39	23·9	J	45 inch	60

At this time the Eclipse had already commenced, the sun having just emerged from the clouds; true time of contact probably 15 seconds earlier.

At greatest obscuration (about $^{h.}_{0}\ ^{m}_{9}$) the distance of the cusps measured $^{r.}_{29{\cdot}32}$ of Troughton's Micrometer: value of 1 rev. $= ^{''}_{44{\cdot}20}$.

	Madras Mean Time.				Observer.		
	d.	*h.*	*m.*	*s.*			
End of the Eclipse	12	1	39	17·1	S	45 inch	55
		1	39	18·1	V	5 foot	60
		1	39	31·8	J	45 inch	60

My observation of the last contact was good, the indentation being clearly seen 3 seconds before; the differences in the time are therefore unaccountable, as S. and V. both considered their observations satisfactory.

OBSERVATION OF THE ECLIPSE OF THE MOON, ON THE 17TH JANUARY, 1851.

	OCCULTATION OF STARS AND PLANETS BY THE MOON.	Madras Mean Time. h. m. s.	Observer.
1848.			
Jan. 10	Disappearance of a very bright star, 3d magnitude,* behind the Moon's dark limb, observed with the 5 feet Achromatic, power 110: at Very good observation.	7 30 14·6	B
„ 12	Disappearance of a star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Very good observation.	7 0 25·4	B
„ 17	Disappearance of a small star, 6½ magnitude, behind the Moon's dark limb, observed with the 5 feet Achromatic, power 110: at Satisfactory observation.	7 21 58·2	B
„ „	Disappearance of a star, 6th magnitude (120 Tauri?), behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Satisfactory observation.	10 23 8·2	B
Mar. 16	Disappearance of *o* Leonis behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at	6 48 19·5	W
Apr. 7	Disappearance of a small star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at	8 8 6·6	V
„ „	Disappearance of a bright star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at	8 11 49·0	V
May 6	Disappearance of a very faint star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Observation unsatisfactory.	7 29 47·1	B
„ „	Disappearance of a small star, 6½ magnitude, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Observation satisfactory.	7 53 47·1	B
„ „	Disappearance of a bright star, 5th magnitude, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Observation good.	8 12 1·6	B
„ „	Disappearance of a star, 6th magnitude, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Good observation.	8 22 19·4	B
Sept. 8	Disappearance of σ^2 Sagittarii behind the Moon's dark limb, observed with 5 feet Achromatic, power 110· at Good observation.	7 38 10·0	B
1849.			
Feb. 26	Disappearance of a star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Very good.	7 35 32·1	A
Mar. 1	Disappearance of a bright star, (75 Tauri?), behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: at Very good.	9 6 29·1	V
„ „	Disappearance of a small star behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: at Very good.	9 11 12·3	W
„ 2	Disappearance of a star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Very satisfactory observation.	11 11 54·0	A
„ 28	Disappearance of a bright star behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: at Good	8 12 44·1	S
„ 30	Disappearance of a bright star behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at Observation very satisfactory.	9 28 19·1	A

* The star was probably B.A.C. 7986, though the magnitude must have been greatly overrated. The magnitudes are given as entered in the Observation book, but are generally too high.

OCCULTATION OF STARS AND PLANETS BY THE MOON.			Madras Mean Time.			Observer.
1849.			*h.*	*m.*	*s.*	
Apr. 26	Disappearance of a bright star, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: Very satisfactory.	at	7	32	1·3	A
„ 27	Disappearance of a bright star, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: Very satisfactory.	at	7	58	48·8	A
„ 30	Disappearance of a bright star, (B. A. C. 3344 ?), behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: Very satisfactory.	at	8	36	28·2	A
June 25	Disappearance of a small star, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: Unsatisfactory.	at	7	58	37·4	V
Augt. 23	Disappearance of B.A.C. 4794, behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: Instantaneous.	at	6	54	33·4	J
Oct. 1	Occultation of Saturn observed with 5 feet Achromatic, power 110· Very hazy, Planet scarcely visible.					
	External contact of ring,	at	15	44	17·2	„
	Do. of Planet,	at	15	45	15·3	„
	Internal contact lost by clouds					
	At Emersion 1st appearance of Planet,	at	16	48	1·9	„
	External contact; Rather dim but no distortion,	at	16	48	30·9	„
	Do. of ring,	at	16	49	23·2	„
12	Occultation of Jupiter observed with 5 feet Achromatic, power 60:					
	Immersion. 1st contact.	at	22	8	48·2	„
	At bright limb. total immersion.*	at	22	10	43·2	„
	Emersion. 1st appearance.†	at	23	16	51·0	„
	At dark limb. external contact.	at	23	18	27·1	„
	The Moon's limb appeared sharp and well defined upon Jupiter, but the Planet's limb was not very well defined.					
„ 20	Disappearance of a bright star behind the Moon's dark limb (NE), observed with 5 feet Achromatic, power 110: Observation very satisfactory.	at	6	25	18·2	V
„ „	Disappearance of a faint star behind the Moon's dark limb (SE), observed with 5 feet Achromatic, power 110:	at	6	28	37·7	V
„ „	Disappearance of a bright star behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: Observation very satisfactory.	at	7	46	46·7	V
„ 23	Disappearance of a star behind the the Moon's dark limb (N), observed with 5 feet Achromatic, power 110: Good observation.	at	8	29	40·5	V
„ 24	Disappearance of a star, 5th magnitude (B.A.C. 7097 ?), behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 100:	at	9	45	34·0	B
Nov. 19	Disappearance of a star, 6th magnitude, behind the Moon's dark limb, observed with 5 feet Achromatic, power 240: Observation good.	at	7	28	24·6	B

* Uncertain to some seconds there being a thick air-haze.

† At first appearance Jupiter seemed to be spread out along the ☾'s limb, but when partially emerged there was no perceptible distortion

	OCCULTATION OF STARS AND PLANETS BY THE MOON	Madras Mean Time			Observer.
1849.		*h.*	*m.*	*s.*	
Nov. 20	Disappearance of a star, 5th magnitude, behind the Moon's dark limb, apparently to the (N.E.) observed with 5 feet Achromatic, power 110: Observation good. at	6	17	47·9	B
„ 21	Disappearance of a star, 7½ magnitude, at Moon's northern cusp; observed with 5 feet Achromatic, power 110. at	6	25	4·3	J
	The star seemed to hang on the limb, for near a minute before disappearing, without any diminution or distortion, but the disappearance was decidedly gradual, occupying perhaps 0·2.				
Dec. 20	Disappearance of a star, 8½ magnitude, at Moon's dark limb, near centre, observed with 5 feet Achromatic, power 110: at pretty good, star's light slightly reduced for 2 or 3 seconds before immersion.	6	47	42·0	J
1850.					
Jan. 21	Disappearance of a star, 5th magnitude, at Moon's (N.E.) limb, observed with 5 feet Achromatic, power 110. at The star appeared to hang on the limb, for near ½ minute before disappearing. Observation very good.	8	38	6·8	B
„ 25	Disappearance of a star, 4th magnitude, (B.A.C 2004?), behind the Moon's eastern limb, observed with 5 feet Achromatic, power 110: Observation very good. at	7	0	11·0	B
Feb. 15	Disappearance of a bright star behind the Moon's dark limb near south, observed with 5 feet Achromatic, power 110: Good observation. at	7	32	36·8	V
„ 16	Disappearance of a bright star, (B.A.C. 388,) behind the Moon's dark limb (South East), observed with 5 feet Achromatic, power 110: at Instantaneous—very good observation.	8	40	44·9	V
Mar. 19	Disappearance of a star, 5th magnitude, in Taurus behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at	6	55	39·4	B
„ „	Disappearance of a star, 5th magnitude, in Taurus behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at	7	10	12·1	B
„ 20	Disappearance of a star, 7th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: at	8	39	52·1	R
„ „	Disappearance of a star, 5th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: at	8	41	34·3	R
„ 21	Disappearance of a star, 5th magnitude, behind the Moon's dark limb (SE), observed with 5 feet Achromatic, power 110: at	7	9	33·7	S
„ „	Disappearance of a star, 6th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: at	8	7	11·2	S
„ „	Disappearance of a star behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: at	9	12	13·6	V
„ 22	Disappearance of B.A.C. 2505 behind the Moon's dark limb (NE), observed with 5 feet Achromatic, power 110: Very satisfactory observation. at	8	19	1·0	A
„ 23	Disappearance of a star, 7th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: Very satisfactory observation. at	11	29	53·8	A
May 17	Disappearance of a star, 6th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 60: Satisfactory observation. at	8	3	23·5	S
„ 18	Disappearance of a star, of about 5th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 60: (Immersion gradual) at	10	49	27·0	A
„ „	Disappearance of Regulus behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 60: at Did not at all lose its brilliancy, but when very near the limb it appeared distorted or rather elongated; the immersion was instantaneous—Clear, very good observation.	10	54	41·4	A

	OCCULTATION OF STARS AND PLANETS BY THE MOON.	Madras Mean Time.			Observer.
1850.		*h.*	*m.*	*s.*	
May 18	Reappearance of Regulus behind the Moon's bright limb (W), observed with 5 feet Achromatic, power 60: at	11	52	33·6	A
	No distortion whatever now, but the image was perfectly round; Emersion instantaneous—Clear, very good observation.

" 10	Disappearance of a star, 5th magnitude, behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 110: at	8	6	43·4	V
" "	Disappearance of a star, 4th magnitude, behind the Moon's dark limb, observed with 5 feet Achromatic, power 110: at	9	48	41·1	B
" 15	Disappearance of χ^1 Orionis, behind the Moon's dark limb (NE), observed with 5 feet Achromatic, power 60: Good observation. at	7	28	10·2	V
" "	Reappearance of χ^1 Orionis, behind the Moon's bright limb (W), observed with 5 feet Achromatic, power 60: Good observation. at	8	40	45.2	V
" 16	Disappearance of a star, 7th mag. 90″ N. of ζ Geminorum, behind the Moon's dark limb, observed with 7 feet Equatorial, power 125 at Not very certain.	10	53	34·8	J
" "	Do. of ζ Geminorum with do. Instantaneous. at	10	56	30·8	J
" "	Do. do. with 5 feet Achromatic, power 60. Good observation. at	10	56	32·1	B
" "	Do. do. with 45 inch. at	10	56	32·8	R
" "	Reappearance of ζ Geminorum behind the Moon's enlightened limb, observed with 7 feet Equatorial.—No projection or distortion; star seen suddenly in contact with the limb, at	12	13	25·9	J
" "	Do. do. with 45 inch Telescope. at	12	13	40·6	R
" "	Do. do. with 5 feet Achromatic, power 60. at	12	13	43·6	B
" 24	Disappearance of ξ^2 Libræ, behind the Moon's bright limb, observed with 5 feet Achromatic, power 60:—Instantaneous. at	17	5	47·9	J
" "	Reappearance of ξ^2 Libræ behind the Moon's dark limb (near the Northern Cusp), observed with 45 inch Telescope. Very good observation, the limb well defined, and the star appeared to stay at the same point for about 2 minutes, or to move along the Moon's border. at	17	52	42·2	R
Feb. 3	Disappearance of a star, 6th magnitude, behind the Moon's dark limb, observed with 45 inch Telescope. Very good observation. at	7	7	59·0	R
" "	Do. do. do. with 5 feet Achromatic, power 60. Good observation. at	7	7	59·2	B

1851.	OCCULTATION OF STARS BY THE MOON.	Madras Mean Time. h.	m.	s.	Observer.
Feb. 5	Disappearance of a star (5th magnitude B.A.C. 81?) behind the Moon's dark limb, observed with 45 inch Telescope. Very good observation. at	7	36	34·5	R
" "	Do. do. do. with 5 feet Achromatic, power 60: Very good observation. at	7	36	34·6	B
" 6	Disappearance of a star, 5th magnitude, (B.A.C. 344?) behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: Very good observation. at	8	29	3·7	B
" "	Do. do. do. with 45 inch Telescope. at	8	29	3·8	R
" 7	Disappearance of a star (6th magnitude) behind the Moon's dark limb, observed with 45 inch Telescope. Good observation. at	7	5	55·4	R
" "	Do. do. with 5 feet Achromatic, power 60: Very good observation. at	7	5	55·6	B
" 10	Disappearance of a star of about 6th magnitude behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: Good observation, but the limb was not well defined. at	7	54	12·6	R
" 12	Disappearance of a star of 5½ magnitude (B.A.C. 2080?) behind the Moon's dark limb, observed with 45 inch Telescope. The dark limb was invisible. Good observation. at	7	27	36·0	R
" "	Do. do. with 5 feet Achromatic, power 60: do. do. Good observation. at	7	27	36·2	B
" 14	Disappearance of δ Cancri at Moon's dark limb (E), with 5 feet Achromatic, power 60: Clear, observation very satisfactory. at	13	17	51·4	V
Mar. 6	Disappearance of a star, 6½ magnitude, behind the Moon's dark limb (SE), observed with 5 feet Achromatic, power 60: at	7	8	58·8	V
" "	Disappearance of a star, 6th magnitude. at	7	9	28·7	V
" 8	Disappearance of a star (5th magnitude) at Moon's dark limb (NE), with 5 feet Achromatic, power 60: at	7	18	23·1	V
" 12	Disappearance of a star (6th magnitude) at Moon's dark limb (SE), with 5 feet Achromatic, power 60: at	7	52	22·5	S
" 20	Reappearance of ξ^2 Libræ behind the Moon's dark limb (NW), with 5 feet Telescope, power 60: at	9	42	17·0	V
April 7	Disappearance of χ^1 Orionis (of 4½ magnitude,) behind the Moon's dark limb (SE), observed with 7 feet Equatorial, power 125. Instantaneous, dark limb barely visible; the star made a sudden move or wriggle about ½ second before disappearing. at	10	24	8·0	J
" "	Do. do. with 5 feet Achromatic, power 60: Good observation. at	10	24	8·7	V
" 17	Disappearance of γ Libræ at Moon's bright limb, with 5 feet Achromatic, power 60: Very good observation. at	11	59	33·1	R
June 24	Disappearance of B.A.C. 845 behind the Moon's bright limb, observed with 5 feet Achromatic, power 110: at	16	33	44·9	R
	The star disappeared instantaneously. Observation good.				
" "	Reappearance of Do. behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: at	17	36	32·2	R
	The limb and star extremely faint by day light, the time doubtful to 4 or 5 seconds, haze.				
Oct. 7	Reappearance of ψ^2 Aquarii behind the Moon's bright limb (W), with 5 feet Achromatic, power 60: Rather hazy—Not satisfactory. at	7	47	3·9	S
" 21	Disappearance of ν Virginis behind the Moon's bright limb (E), with 5 feet Achromatic, power 60· Good observation. at	17	7	38·5	S
Nov. 27	Disappearance of a star (of about 7½ magnitude) behind the Moon's dark limb, with 5 feet Achromatic, power 60: at	7	37	8·5	R

OCCULTATION OF STARS BY THE MOON.		Madras Mean Time.			Observer.
1851.					
		h.	*m.*	*s.*	
Nov. 27	Disappearance of a star, 6th magnitude, doubtful. at	7	37	51·4	R
" "	Disappearance of a star (of about 7th magnitude), behind the Moon's dark limb, with 5 feet Achromatic, power 60: at	8	24	53·6	V
Dec. 19	Disappearance of η Libræ, behind the Moon's bright limb (E), with 5 feet Achromatic, power 60: Good observation. at	17	55	6·1	S
1852.					
Jan. 28	Disappearance of a star of about 4½ magnitude behind the Moon's dark limb, with 5 feet Achromatic, power 60: at	7	34	6·4	S
Feb. 2	Disappearance of a star of about 5th magnitude behind the Moon's dark limb, with 5 feet Achromatic, power 60: Good observation. at	7	36	23·6	R
" 25	Disappearance of a star of about 6th magnitude behind the Moon's dark limb, (about 15° from N. Point) with 5 feet Achromatic, power 60: at	7	45	4·0	R
" 26	Disappearance of a star of about 6th magnitude behind the Moon's dark limb, (about 75° from N. Point) with 5 feet Achromatic, power 60: Good observation. at	7	5	18·5	R
" "	Disappearance of a star of 5½ magnitude behind the Moon's dark limb, with 5 feet Achromatic, power 110· Good. at	8	10	41·2	S
Mar. 6	Disappearance of ν Virginis behind the Moon's bright limb (E), observed with 5 feet Achromatic, power 60: Moon in the horizon—haze. Observation unsatisfactory. at	6	49	58·3	M
" "	Reappearance of do. at	7	24	15·7	R
" 27	Disappearance of a star, (6th magnitude) behind the Moon's dark limb, observed with 5 feet Achromatic, power 60: Good observation. at	9	4	34·2	B
" 28	Disappearance of μ Geminorum behind the Moon's dark limb, observed with 7 feet Equatorial, power 125: at	2	59	8·7	J
	The star suffered a small diminution of light and was slightly agitated for about two seconds before disappearance, which was also not quite instantaneous.				
" "	Reappearance of do. observed with 7 feet Equatorial: Instantaneous, no projection, but the star seemed to hang on the limb for about 2″. at	4	27	36·7	J
Apr. 3	Disappearance of c Virginis behind the Moon's dark limb (E), observed with 7 feet Equatorial, aperture 4 inches, power 200: Instantaneous, no distortion. at	9	1	38·4	J
" "	Do. do. with 5 feet Achromatic, power 60: Observation very satisfactory. at	9	1	38·7	B
" "	Reappearance of do. behind the Moon's enlightened limb (W), observed with 7 feet Equatorial, at	10	8	35·0	J
	Star seen nearly 1″ from limb, rather faint but no distortion.				
" "	Do. do. with 5 feet Achromatic, power 60· at	10	9	5·1	B
" 24	Disappearance of red star 6½ magnitude (B.A.C. 1987) observed with 7 feet Equatorial, power 169: at	6	53	42·0	J
	No projection or distortion, but the star seemed to slide behind the limb, occupying nearly 0·1″ in disappearing.				
" "	Do. do. with 5 feet Telescope, power 60: at	6	53	42·4	R
" "	Reappearance of do. observed with 7 feet Equatorial, power 169: Instantaneous. at	7	38	8·7	J
" "	Disappearance of η Geminorum behind the Moon's dark limb (SE), observed with 5 feet Achromatic, power 60: at	8	16	35·8	S

1852.	OCCULTATION OF STARS BY THE MOON.		Madras Mean Time. h.	m.	s.	Observer.
April 24	Disappearance of η Geminorum behind the Moon's dark limb (SE), observed with 45 inch.	at	8	16	36·3	M
„ „	Do. do. with 7 feet Equatorial, power 169 : Hazy—instantaneous.	at	8	16	36·4	J
„ „	Reappearance of do. behind the Moon's bright limb observed with 5 feet Achromatic, power 60 : Haze.	at	9	15	54·0	S
„ 26	Disappearance of a star about $5\frac{1}{2}$ magnitude (B.A.C. 2714?) behind the Moon's dark limb (SE), observed with 5 feet Achromatic, power 60 : Rather hazy.	at	8	31	40·3	S
„ 27	Disappearance of a star about $6\frac{1}{2}$ magnitude behind the Moon's dark limb (E), observed with 5 feet Achromatic, power 60 : Good.	at	8	39	55·0	S
May 13	Disappearance of 33 Piscium behind the Moon's bright limb, observed with 5 feet Achromatic, power 60 : Instantaneous, satisfactory, hazy.	at	15	48	42·5	R
„ „	Reappearance of do. with do. behind the Moon's dark limb. Very good observation—hazy.	at	16	20	24·0	R
Sept. 22	Reappearance of No. 6864 B.A.C. observed with 5 feet Achromatic, power 60 : Very good observation.	at	11	23	51·1	R
Oct. 30	Reappearance of s Tauri behind the Moon's dark limb (SW), observed with 5 feet Achromatic, power 60 : Haze, not satisfactory.	at	7	59	13·8	S

W. refers to Captain W. K. Worster.

M. „ to T. Moottoosawmy Pillay.

APPENDIX

CONTAINING

OBSERVATIONS

MADE AT THE MADRAS OBSERVATORY,

WITH THE

LEREBOURS EQUATORIAL,

SUBSEQUENT TO THE ARRIVAL OF THE NEW OBJECT GLASS IN 1852

ALSO

A DISCUSSION OF THE PARALLAX

OF α HERCULIS.

105 DOUBLE STARS OBSERVED WITH THE LEREBOURS EQUATORIAL.

549 Taken with Troughton's Micrometer and Barlow lens.
561 Taken with Lerebours' Micrometer. B has rather a greenish tinge.
563 Barely divided.
564, 565 Well divided.
576 Taken with Troughton's Micrometer.
578 Do. and Barlow lens.
585 Frequently obscured by clouds, which prevented the distance being taken.
589 Exactly at sunset.

* Estimated.

640 B seen only by glimpses, doubtful.
641 Still only glimpses of B, but rather more certain.
642 Very difficult.
657 Nearly equal.
675 The components would appear to be variable.
678 Just divided.
681 Taken with Lerebours' Micrometer.

* Estimated. † Diff. Declination.

687 Slightly tremulous.

696 A follows Procyon by 42·6, at an angle of 100·5.

699 The 3 are almost exactly in line.

701 Exactly in line.

718 Doubtful.

719 Definition much better: small end of *egg* plainly directed *np*: doubtful if any advantage from using the higher power

720 Very doubtful.

721 Rather better.

726 In contact, very difficult; closer than ε Arietis.

* Estimated.

781 Taken with Lerebours' Micrometer.
783 At sunrise.
784 Just before sunrise.
788 Taken with triangular aperture, not much improved.
808 Clearly divided; nearly equal.
809 The preceding star seems now the smaller if any thing.
817 The measure of distance is too great, wires fiddle.
823 Very doubtful; at times it appears almost round.
824 Even more doubtful than before. Angle may be 259.
825 Well elongated with 365 · little improvement with 650.
826 Seen better than yesterday, definition excellent.

* Estimated.

828 Very difficult. Tried 650 but with no improvement.

829 Very difficult, position from $\mu = 171°·7$.

832 Discs in contact; measured distance too great, wires fiddle.

833 Separated by fits; the preceding star certainly the least, but the difference is scarcely $\frac{1}{3}$ a magnitude.

834 Elongation plainly seen with 365; doubtful if any advantage from the higher power; this star is now much easier than η.

835 Elongation less decided than yesterday, the definition being not quite so perfect.

836 Daylight; notched.

837 Discs in contact.

840 Hazy and flying clouds; definition blurred

845 Distance rejected as the wires fiddle

857 Hazy with cir-strat., clouds; def. blurred.

864 Position may be 214°

865 The stars are still almost exactly equal, the *sp.* the larger if any thing.

* Estimated.

874 Definition excellent.

881 By the time the measures of position were taken, B was too faint for distance.

884 Definition superb

888 Fog; some dew on the object glass, in spite of the cap.

904 Sky hazy, definition excellent.

926 Wires fiddle slightly
932 Flying clouds; stars moulding.
934 Just after sunrise; rather faint; heavy dew.
935 Just before sunrise, wind S. sky hazy; no dew.
940 Just before sunrise, the Northern star is now the brighter if any thing.

966 Sky hazy, definition good.
970 Hazy and flying clouds; definition fair.
972 Sky hazy, definition good.
980 Taken with Troughton's Micrometer and Barlow lens.
985 Troughton's Micrometer.
991 Sky hazy, and flying clouds.
993 Rather difficult.
994 Very difficult; the sky is hazy, yet the former estimate of the magnitudes must surely be too high.
996 Omitted in its proper place through inadvertence.

N. B.—All the Observations given in this Appendix were taken with Dollond's Micrometer, unless otherwise noted.

MEAN RESULTS OF THE FOREGOING MEASURES OF DOUBLE STARS.

394 Little or no change.

395 The angle progresses 0°·3 per annum; distance apparently on the increase.

396 Still no apparent change since 1846.

400 The angle continues to recede, and the decrease in distance is accelerating—the star should be closely watched.

401 Probably unchanged.

402 The angle appears to have receded.

410 The angle seems slowly advancing; distance steady.

414 The suspected orbital movement of this star is not confirmed, but it should be carefully watched, as the changes noticed in the angle may perhaps prove to be parallactic.

415 The angle appears receding, and the distance increasing.

427 These Observations were taken as trials of parallax, and the differences are in the right direction.

431 The differences are distressingly irregular.

436 The angle appears slowly receding, and the distance decreasing.

437 A probable advance of about 0°·2 per annum.

* Estimated. † Diff. declination.

449 There appears little or no change in this star.

454 The angle appears to recede nearly 0°·2 per annum, while the distance is slowly decreasing.

457 It may be doubted if this is a binary system, for the relative motion does not differ sensibly from a straight line, a proper motion of 0″·04 would account for the changes.

458 There appears a small change, of about —0°·3 per annum, in the angle, but little or none in the distance.

460 Perhaps a change of about —0°·1 per annum in the angle; distance nearly constant.

461 The progression is still doubtful.

463 The angle seems to have decreased and the distance increased since Herschel's Cape measures, but the star is difficult and the change is therefore doubtful.

464 The slow progression of the angle continues, and the distance appears to be coming to a maximum.

465 These places agree very nearly with M. Yvon Villarceau's last orbit.

467 Apparently unchanged.

475 The components must certainly be variable.

476 For a discussion of the parallax of this star, see p. (19).

480 The distance is perceptibly decreasing.

482 There will probably be an appulse of this pair about 1863; and the period seems somewhere about 100 years.

486 The relative motion of these stars appears to differ little from a strait line, so that there may still be some doubt of their physical connection.

488 The changes of this pair are probably due to the proper motion of A.

492 Little or no change.

* Estimated.

PARALLAX OF α HERCULIS.*

In the notes to the 1st Series of Observations of Double Stars, made with the Lerebours' Equatorial, it was pointed out that the Observations of α Herculis gave indications of parallax. In consequence of these indications, the pair was sedulously observed during the years 1852-3, not only at the times when the effect of parallax on the position-angle was near a maximum, but also at intermediate points, with a view to ascertain if the curve of parallax could be traced out with any degree of precision.

The result has been most satisfactory, as will be apparent from an inspection of Fig. 5, where the observed positions are compared with the curve corresponding to a constant of parallax of 0″·06, which would cause an extreme variation in the angle of about 1°·0. The dotted curve line shows the position angle at any given time as affected by a parallax of the above amount, and the mark ⊙ indicates the several observed positions, which will be seen to agree with the curve within a very moderate amount of error.

The effect of parallax on the position-angle is shown in Fig. 6, where AB is the meridian, C the position of the larger Star unaffected by parallax, or as it would appear from the Sun's Centre, DGEF the path described in consequence of parallax, DE the circle of latitude, and consequently D & E the points where the Star will be found when the earth's longitude is equal to, or differs by 180° from, that of the Star, S the place of the smaller Star supposed unaffected by parallax. Then, if x be the constant of parallax for the earth's mean distance from the Sun R the earth's radius vector for the time being, & λ the Star's latitude; ∴ CG = R.x & CD = R.x sin. λ; and the equation of condition for any observed angle of position will be

$$Z' = Z + \frac{57{\cdot}3\ \varrho\ x \sin X}{d} + (t - 1853{\cdot}0)\ m$$

Where Z' is the *apparent* position-angle in degrees.
Z – the *mean* position-angle for 1853·0.
d – the *apparent* distance of the Stars.
x – the constant of parallax.
ϱx – the elliptic radius CI for the given time.
X – the angle SCI reckoned from SC in the order FDGE.
t – the time of observation.
m – the annual change in the position angle—arising from proper motion.

The co-efficient ϱ of the elliptic radius, and its inclination to the meridian from which to deduce X, can be computed in the following manner. Let L be the earth's longitude at the given time, l that of the Star, I the angle DCI, and A the angle ACD; and make p = R. cos (L − l).

q = R. sin (L − l).

$$\text{then Cot. } I = \frac{p.\ \sin \lambda}{q}$$

$$\varrho = q.\ \text{cosec } I$$

$$\& \quad X = Z + I - A$$

The angle A being the angle of *situation* of the Star is = 6° 28½′ = 6°.48.

* For the Observations here discussed see pp. 66, 76, and (11), (17) of this Appendix.

The several equations of condition are then as follow:—

								Weight.
Z	—	1·247	m	—	$\frac{57\cdot3 \times \cdot571 \times x}{4\cdot57}$	=	117·73	16
Z	—	·748	m	+	$\frac{57\cdot3 \times \cdot603 \times x}{4\cdot45}$	=	118·43	27
Z	—	·264	m	—	$\frac{57\cdot3 \times \cdot530 \times x}{4\cdot39}$	=	117·44	24
Z	—	·212	m	—	$\frac{57\cdot3 \times \cdot626 \times x}{4\cdot610}$	=	117·45	20
Z	—	·180	m	—	$\frac{57\cdot3 \times \cdot662 \times x}{4\cdot58}$	=	117·80	14
Z	+	·089	m	—	$\frac{57\cdot3 \times 175 \times x}{4\cdot54}$	=	118·02	24
Z	+	·127	m	+	$\frac{57\cdot3 \times \cdot181 \times x}{4\cdot627}$	=	118.175	22·5
Z	+	·268	m	+	$\frac{57\cdot3 \times \cdot629 \times x}{4\cdot46}$	=	118·515	27
Z	+	·776	m	—	$\frac{57\cdot3 \times \cdot609 \times x}{4\cdot58}$	=	117·89	24
Z	+	1·042	m	—	$\frac{57\cdot3 \times \cdot165 \times x}{4\cdot375}$	=	117·75	19
Z	+	1·094	m	+	$\frac{57\cdot3 \times 054 \times x}{4\cdot45}$	=	118·04	21

or subtracting 117° from each side, and calling $Z - 117 = z$.

1	z	—	1·247 m	—	7·16 x	=		·73
2	z	—	·748 m	+	7·76 x	=		1·43
3	z	—	·264 m	—	6·92 x	=		·44
4	z	—	·212 m	—	7·77 x	=		·45
5	z	—	·180 m	—	8·28 x	=		·80
6	z	+	·089 m	—	2·21 x	=		1·02
7	z	+	·127 m	+	2·24 x	=		1·75
8	z	+	·268 m	+	8·08 x	=		1·515
9	z	+	·776 m	—	7·70 x	=		·39
10	z	+	1·042 m	—	2·16 x	=		·75
11	z	+	1·094 m	+	·69 x	=		1·04

Multiplying these by their respective weights they become

16	z	—	19·95 m	—	114·6 x	=	11·68
27	z	—	20·20 m	+	209·6 x	=	38·61
24	z	—	6 34 m	—	166·1 x	=	10·56
20	z	—	4·24 m	—	155·4 x	=	9·00
14	z	—	2·52 m	—	115·9 x	=	11·20
24	z	+	·94 m	—	53·0 x	=	24·48
22·5	z	+	2·86 m	+	50·4 x	=	26·44
27	z	+	7·24 m	+	218·2 x	=	40·09
24	z	+	18·62 m	—	184·8 x	=	9·86
19	z	+	19·80 m	—	41·8 x	=	14·25
21	z	+	22·97 m	+	14·5 x	=	21·84

Resolving these by the method of least squares we find

$$z = \cdot9846 - \cdot0756\, m \qquad x = + \cdot06033 + \cdot0091\, m$$

m, being a very small quantity, will not materially affect the result; its value derived from these observations is $= -0\cdot045$* which agrees pretty well with that derived from a comparison of the observations for the last 30 years; assuming this value we get,

$$Z = 117\cdot988 \pm \cdot023 \qquad x = 0\cdot05993 \pm \cdot00410$$

The probable error of x being only $\frac{1}{12}$ of itself, the value may be considered as pretty near the truth; this of course is only the *difference* of parallax of the two stars, it is therefore possible that that of A may be somewhat greater.

It will be satisfactory to have the above result confirmed by the measures of distance, though the quantity is almost too small to be so dealt with, being less than the probable error of observation under the most favorable circumstances; and an inspection of the column of distances, though detecting here and there slight traces of parallax, certainly does not show any thing like the regular series observable in the positions.

* The value is, $m = -0\cdot045 \pm \cdot043$, or the probable error is nearly equal to the whole quantity; *i. e.* m is probably between 0 and $-\cdot09$; but it is evident that an alteration between these limits will scarcely affect the value of x.

The equation of condition for any observed distance will be, $d' = d - \varrho\, x.\ \cos X + (t - 1853\text{-}0)\, n.$ where d is the mean distance for epoch 1853-0, & n the annual change in distance from proper motion.

The several equations are as follow:—

								Weight.
(1)	d	+	·747 x	—	1·247 n	=	4·657	2
(2)	d	—	·686 x	—	·748 n	=	4·498	2
(3)	d	+	·823 x	—	·270 n	=	4·39	1·5
(4)	d	+	·596 x	—	·212 n	=	4·616	2
(5)	d	+	·421 x	—	·180 n	=	4.58	1
(6)	d	—	·781 x	+	·039 n	=	4·53	1·5
(7)	d	—	·945 x	+	·127 n	=	4·62	1·5
(8)	d	—	·623 x	+	·268 n	=	4·46	2
(9)	d	+	·645 x	+	·776 n	=	4·53	2
(10)	d	—	·786 x	+	1·042 n	=	4·875	2
(11)	d	—	·912 x	+	1·094 n	=	4·45	1·5

The weights assigned are derived from those given in the register by dividing by 7, and taking the nearest integer or half-integer; this was to save the trouble of dealing with large quantities, and the effect on the result will be scarcely sensible.

The solution of the above by least squares gives,

$$x = + 0''\cdot06125 + \cdot399\ n$$
$$d = + 4\cdot525 + \cdot0015\ n$$

The value of n must be very small, not exceeding at most 0″·08; x & d will be therefore but little affected by it; the observations are insufficient to give this value even approximately;* but a comparison with the measures of Herschell and South in 1821 gives — ·024; with those of Struve in 1829, — ·006; and with those of Dawes in 1830, — ·018; assuming it at — ·016 the above results become

$$x = + 0''\cdot0549 \pm \cdot0227$$
$$d = 4\cdot525 \pm \cdot0165$$

This value of x agrees sufficiently well with that derived from the positions, the probable error, as might be expected being much larger. The residual errors of each set after correcting for x, m, & n, are exhibited below.

		1	2	3	4	5	6	7	8	9	10	11
Position.	in angle	—°·104	—·058	—·146	—·082	+·299	+·176	+·058	+·024	—·102	—·059	+·060
	in arc	″·009	·005	·012	·006	·024	·014	·004	·002	·008	·005	·005
Distance.		+ ″·072	—·002	—·184	+·056	+·029	+·048	+·149	—·027	—·018	—·090	—·008

The errors in distance look probable enough, while those in the positions will doubtless appear *improbably* small; the average error of a good night's observation being somewhere about 0″·04, so that the mean of 4 sets might be expected to shew an average of about 0″·02, instead of 0·008 as above; but it must be borne in mind that these observations were taken with unusual care, and under highly favorable circumstances; none being taken unless the definition was unexceptionable, and nearly the whole observed by daylight, a circumstance, according to my experience, remarkably favorable to accuracy.

As it has occurred to me, that the variations in the angles of position might perhaps be attributed to a bias in the Observer's eye, from observing on different sides of the meridian, it may be well to state, that all the observations, excepting those entering into equations 6, 7, 10 & 11 were taken about 1ʰ or 2ʰ W. of the meridian; those in the excepted equations were from necessity taken E of the meridian, but they are just the ones which produce the least effect on the result, on account of the co-efficient of x being small; moreover they do not indicate any sensible bias of the kind alluded to. In like manner a periodical change of the distance might be attributed to temperature; but the range of temperature throughout the observations was small, scarcely exceeding 10°, and would also have had an *opposing* effect, from the minimum temperature occurring about the time of least apparent distance; i. e. it would *diminish* the apparent parallax; and in fact we find the parallax derived from the distances somewhat less than that from the positions.

It is, however, to be hoped that the subject will be taken in hand at some other Observatory, so that the above results may be confirmed.

* The value derived from the above equations is, $n = -\cdot031 \pm \cdot029$; from which it can only be inferred that n is probably between ·002 and ·060.
